siderolite (sid'e-rō-līt), *n.* [*Gr. σίδηρος*, iron, + *λίθος*, stone.] 1. A name first given by N. S. Maskelyne (in the form *aëro-siderolite*) to those meteorites which G. Rose had previously called *pallasites*. For meteorites consisting chiefly of metallic (nickeliferous) iron the name *siderite* was proposed by C. U. Shepard, and that of *holosiderite* by Daubrée; but the former is not admissible, because this name was long ago preoccupied by a well-known and widely distributed mineral species, and the latter cannot be accepted, because the majority of the specimens so designated are not wholly of iron. The name *siderolite* has therefore been transferred by M. F. Wadsworth to those meteorites which are composed more or less irregular and nodular masses of pyrrhotite, schreibersite, graphite, etc. The same author includes in *siderolite* masses of iron of similar character although of terrestrial origin, as those of Ovikak in Greenland. In general, this school is characterized by a coloring at once harmonious and brilliant, by a predilection for rich costumes and accessories, and by a notable power of sentimental expression. It is inferior to the Florentine school in the grouping of its figures and in vigor and correctness of drawing. 1. A ferruginous ochreous earth, fine and smooth, used as a pigment in both oil and water-color painting. The finest is that obtained from Italy. *Raw sienna* is the native pigment prepared by simply drying the material which is taken from the mine or vein and afterward powdering. In composition and appearance it somewhat resembles yellow ochre, but it is deeper in tint and of a browner hue. It gives a highly chromatic orange-yellow, considerably darkened, its luminosity being about half that of a bright chrome-yellow. Its transparency is one of its important qualities, while opacity should be the characteristic of an ochre. *Burnt sienna* is the raw material roasted in a furnace before powdering. By this means the color is changed to a warm reddish brown similar to old mahogany. It is, like raw sienna, translucent in body.

The thin areas or panels are called *sieve-plates*, and the perforations permitting com-

munication between the cells, *sieve-pores*. Sieve-cells constitute an essential element of fibrovascular bundles, and, taken collectively, form *sieve-tissue*, or *cribriform tissue*. See *cribriform tissue*, *liber*.

See *reflecting*.—**Second sight**, a faculty of internal sight supposed to be possessed by some persons, whereby they see distant objects or occurrences, or foresee future events, as if present before their eyes; so called because it takes the place of natural sight, which for the time is in abeyance. Sigillaria (si'jil-lä-ri-ä), *n.* [NL. (Brongniart, 1822), *< L. sigillum, a seal; see sigil.*] A genus of very important and widely spread fossil plants which occur in the (Carboniferous) coal-measures, and which are especially characteristic of the middle section of the series. *Sigillaria* is a tree often of large size, and chiefly known by the peculiar markings on the trunk, which in some respects resemble those which characterize *Lepidodendron*. These markings are leaf-scars, and they occur spirally distributed around the stem, and generally arranged on vertical ridges or ribs. Great numbers of species have been described, the variations in the form and arrangement of the leaf-scars and of the vascular scars being the points chiefly relied on for specific distinction. *Sigillaria* is but imperfectly known, so far as foliage and fruit are

concerned, but most paleobotanists consider it probable that it will be eventually proved to be closely related to *Lepidodendron*; others refer it to the cycads; while there are some who maintain that it is probable that various plants quite different from one another in their systematic position have been included under the name *Sigillaria*.

Occasions for the use of formal *signals* abound particularly in military operations, navigation, railroading, and telegraphing (especially by means of semaphores); and the methods and devices employed are almost innumerable. See cut under *semaphore*.

Nautical signal, a signal serving as a means of communication between vessels at sea, or between a vessel and the shore. It consists of flags of different colors for use in the daytime, or of lanterns or fireworks at night. The various combinations of flags or of lanterns express each some phrase or sentence that may be necessary in directing the movements of a fleet or a single vessel, answering signals of other vessels, making known the wants of the vessel displaying it, or simply for communicating information. On a smaller scale, a single flag, by its position,

etc., is made to express various meanings.—**On-shore signal**, a signal formerly displayed at lake ports by the United States Signal-service as a warning to small vessels when the wind was expected to blow in an on-shore direction with a velocity of from 20 to 35 miles per hour.—**Signal Corps**, a corps of the United States army charged with the general signal-service of the army, with the erection, equipment, and management of field-telegraphs used with military forces in the field, with constructing and operating military telegraph-lines, and all other duties usually pertaining to military signaling. By act of October 1st, 1891, a Weather Bureau was created in the Department of Agriculture, and the meteorological duties devolving upon the Signal-service Bureau were transferred thereto.—**Storm signal**, a red flag with black center, hoisted by the United States Weather Bureau at sea-coast and lake stations, warning seamen to expect violent and dangerous gales.—**To repeat signals** (*naut.*). signal-fire (sig'nal-fir), *n.* A fire intended for a signal; a beacon-fire. Signal-fires were formerly often built on high points for the gathering of members of a clan, tribe, or other organization for hostile or predatory operations. They were also lighted on sea-coasts for the guidance of vessels, and in semi-barbarous times or places often as a lure for their destruction for the sake of plunder. The earliest lighthouses were supplied with signal-fires instead of lamps. Such fires, or rather the dense columns of smoke made to arise from them, are still largely in use for signaling purposes among the North American Indians.

signal-flag (sig'nal-flag), *n.* A flag used in or adapted for signaling; especially, one of a set of flags of different colors, shapes, and markings, which, singly or in various combinations, have different significations, intelligible either in one language or service, or in all languages. Specifically—2. An external natural marking upon, or a symbolical appearance or characteristic of, a plant, mineral, or other object or substance, formerly supposed by the Paracelsians (and still by some ignorant persons) to indicate its special medicinal quality or appropriate use. The medical theory based upon this conception, known as the *doctrine of signatures*, took note of color (as yellow flowers for jaundice and the bloodstone for hemorrhage), shape (as that of the roots of mandrake and ginseng), various peculiarities of marking, etc. Many existing names of plants, minerals, etc., originated from this theory. See *Kidneywort*, *mandrake*, *scorpion-grass*. Also called *sign*, *seal*, and *sigil*.

Some also, pretending themselves *Natures Principall Secretaries*, have found out [in certain plants] . . . *Signatures* of *Natures* own impression, fitted to their several and special uses in Physicke. *Purchas*, Pilgrimage, p. 505.

W. K. Clifford, Lectures, I. 130.

3. The name of a person, or something used as representing his name, affixed or appended to a writing or the like, either by himself or by deputy, as a verification, authentication, or assent (as to a petition or a pledge). The initials, the first or familiar name by which one is known, or the mark or sign of the cross, and the like, if affixed by the person for that purpose, is a legal signature. A British peer uses his title as signature: thus, the Marquis of Salisbury signs himself simply "Salisbury." Prelates of the Church of England adopt signatures from the Latinized designations of their sees: thus, the Archbishop of Canterbury (E. W. Benson) signs himself "E. W. Cantuar.," the Bishop of Oxford (W. Stubbs), "W. Oxon." See *sign*, *v. t.*, 2, 3.

4. In *Scots law*, a writing formerly prepared and presented by a writer to the signet to the baron of exchequer, as the ground of a royal grant to the person in whose name it was presented. This, having in the case of an original charter the sign manual of the sovereign, and in other cases the *cachet* appointed by the act of union for Scotland, attached to it, became the warrant of a conveyance under one or other of the seals, according to the nature of the subject or the object in view. *Imp. Diet.*

5. A letter or figure placed by the printer at the foot of the first page of every section or gathering of a book. The letters begin with A, the figures with 1, and follow in regular order on succeeding sections. They are intended to aid the binder in folding, collating, and arranging the sections consecutively. In early printed books the signature-mark was often repeated on the 3d, 5th, and 7th pages of a section of 16 pages as an additional safeguard for the folder: as, A on 1st page, A i on 3d, A ii on 5th, and A iv on 7th page. This practice has been discontinued except for offsets of 12mo's, which have the signature repeated.

Hence—6. A sheet; especially, in bookbinders' use, a sheet after it has been folded and is ready to be gathered.—7. In *musical notation*, the signs placed at the beginning of a staff to indicate the key (tonality) and the rhythm of a piece. The term properly includes the clef (which see), since it determines the form of the key-signature. The key-signature consists of sharps or flats placed upon the keyboard that are to be used; their number and position show also the position of the key-note. The key-signature of a minor key is the same as that of its relative major key. A key-signature made up of sharps is called a *sharp signature*; one made up of flats is called a *flat signature*. The key-signature may be altered in the course of the piece. In this case a heavy bar is inserted, and the sharps or flats that are not to continue in force are nullified by cancels (naturals) prefixed to the new signature. The key-signatures most in use with the common G and F clefs are as follows:

Some slight variations in the above forms occur. (See *key*, *key-signature*, and *circle of keys* (under *circle*)). The rhythmical signature, or time-signature, consists of two numerals, the upper of which indicates the number of principal beats in the measure, and the lower the kind of note chosen to represent one such beat. (See *rhythm*, and *rhythmical signature* (under *rhythmical*)). The key-signature is usually repeated at the beginning of every brace; but the rhythmical signature is given but once.

A seal, especially a private seal, used instead of signing the name, or in addition to it, for verification of papers or the like. The signet in Scotland is a seal by which royal warrants connected with the administration of justice were formerly authenticated. Hence the title of *writers to the signet* or *clerks of the signet*, a class of legal practitioners in Edinburgh who formerly had important privileges, which are now nearly abolished. They act generally as agents or attorneys in conducting cases before the Court of Session. In English administration the signet is one of the seals for the authentication of royal grants, which before the abolition of the signet-office in 1848 was there affixed to documents before passing the privy seal, but it is not now required.

It is characterized by flowers usually with a ten-nerved five-toothed club-shaped ovoid or inflated calyx, five spreading petals upon erect and slender claws commonly with two small scales, ten stamens, and a stalked ovary with one cell, a free central placenta, and usually three styles, the capsule opening at the top by six or by three short valves to discharge the numerous opaque and roughened seeds. About 480 species have been described, but only about 250 are now thought to be distinct. They are annual or perennial herbs of great variety of habit, tall and erect, tufted or procumbent, or partial climbers, with narrow entire opposite leaves, and pink, scarlet, white, or variously colored flowers, commonly in cymes or in one-sided spikes disposed in a terminal panicle. They are abundant in Asia north of the tropics, and in southern Europe and northern Africa, and there are about 12 species in South Africa. Besides 5 or 6 introduced species in the Atlantic border, the United States contains about 32 species, chiefly in the Rocky Mountain and Pacific region, about half of which are nearly or quite confined to California. Most of the species are known as *catch-fly*. Many are cultivated for their flowers, especially *S. viscosa* and *S. Schafta*, with *S. Many species with an inflated bladder-like calyx are known in general as *campion*, among which *S. Cucubalus* (*S. inflata*), the bladder-campion, is a wide-spread species of Europe, central and northern Asia, now introduced in the Atlantic United States. It is also called *belen* and *spatling-poppy*; also, from the shape of its calyx, in America *couch*. It includes 11 genera, all natives of the Old World except certain species of *Dianthus* and *Silene*. (See also *Saponaria*, *Lycnitis*, and *Gypsophila*.) Most of the genera are cultivated for their ornamental flowers, as the pink, catchfly, etc., which resemble salver-shaped flowers, as *phlox*, in form, but are composed of separate petals.

silent-alarm system. See *fire-alarm telegraph*, under *fire-alarm*.—**Silent letter**, a letter of a word which is not sounded or pronounced in the enunciation of the word, as the *b* in *doubt*, the *e* in *virtual*, the *d* in *handsome*, the second of the two like consonants in *ebb*, *odd*, *off*, etc. The silent letter may be wholly useless, as in the above examples, or it may serve as an accidental or conventional index of the sound given to some adjacent letter: thus, the *e* in *bate*, *mete*, *bite*, *note*, *mute*, etc., is silent, but it indicates that the preceding vowel is long; the *e* in *indict*, the *g* in *sign*, the *l* in *balm*, etc., serve a similar purpose. Silent letters are traditional, representing sounds that once existed in the word, either in English or in the original tongue (as the *p* and *t* in *psalm*, pronounced in Latin *psalmus*, Greek *ψαλμός*), though often, as in this case, artificially restored after having been omitted (AS. *sealm*, ME. *salin*, *saume*), or have been foisted in to suit some false etymology or erroneous analogy, as the *l* in *could*, the *g* in *foreign*, the *p* in *plarmigan*, etc. The proportion of silent letters in the present English spelling is about 12½ per cent.—**Silent spirit**, distilled spirit which is nearly or quite destitute of flavor and odor. Compare *silence*, 4.—**Silent system**, a system of prison discipline which imposes entire silence among the prisoners, even when assembled together.—**Silent Week**, Holy Week. Also *Still Week*.—**The Silent Sister**, an ironical name of Ireland.—**Syn. 1 and 2. Silent, Taciturn, Dumb, Mute.** *Silent* expresses the fact of not speaking, *taciturn* the habitual disposition to refrain from speaking. *Dumb* strictly implies lack of the organs of speech, or defect in them, or lack of the power of speaking, while *mute* implies some special cause: hence *deaf-mute* is thought by many a better name than *deaf-and-dumb person* for one who does not speak on account of deafness; an idol is *dumb*, not *mute*. Under figurative extension *mute*, *dumb*, and *silent* are often used outside of the lines here indicated. In such freer use there is an advance in strength from *silent* to *mute* and from *mute* to *dumb*: as, *silent* from abstraction; *mute* with astonishment; *struck dumb* with horror.

silica (sil'i-kä), *n.* [*NL. < L. silice* (*silic*), flint: see *silex*.] Silicic diacid (SiO₂), or silicic anhydride, a white or colorless substance, nearly insoluble in water and in all acids except hydrofluoric acid. Silica is extremely hard, and fuses with difficulty in the oxyhydrogen flame to a colorless amorphous glass. In nature, as quartz, it is universally distributed, and is the commonest of minerals; here belong the varieties rock-crystal, amethyst, chalcedony,

agate, carnelian, onyx, jasper, flint, hornstone, etc., which differ in degree of crystallization and in purity, and hence in color. Silica in the form of quartz makes the sand of the sea-shore, and rock-masses as quartzite and sandstone. It also occurs as the rare mineral tridymite, known only in volcanic rocks and in a few meteorites, and as the amorphous opal, which is softer and more soluble than quartz and contains more or less water. (See *quartz*, *tridymite*, *opal*, also *asmanite*, *cristobalite*, *melanophlogite*.) Silica also forms the material of the spicules of many sponges and of the frustules of diatoms; deposits of the latter are not uncommon under peat-swamps, and in some regions vast beds have been accumulated. (See *infusorial earth*, under *infusorial*.) Silica combines with bases to form compounds called *silicates*, which constitute the rocky crust of the globe. It occurs in solution in the waters of many mineral springs, and sometimes is deposited in enormous quantities about geyser-basins. From the silicates taken up by plants silica is often deposited on the surface or in the interior of their stems. The value of the equisetum, or scouring-rush, is due to the silica contained in it, which sometimes amounts to 18 per cent. of the fresh plant. Sand is extensively used for the manufacture of glass and mortar. The prominent silicates recognized among minerals are the *metasilicates*, salts of metasilicic acid (H₂SiO₃), and *orthosilicates*, salts of orthosilicic acid (H₄SiO₄). Examples are rhodonite, or manganese metasilicate (MnSiO₃), and willemite, or zinc orthosilicate (Zn₂SiO₄). There are also disilicates, polysilicates, etc., but they are rarer, and their nature is less clearly understood. See *glass*, *mortar*, 2, and *sand*, 1. Also called *silex*.—**Infusorial silica**. Same as *infusorial earth* (which see, under *infusorial*).—**Silica bandage**, in *surg.*, a bandage which is moistened with sodium silicate after having been applied.

silicate (sil'i-kät), *n.* [*< silic* + *-ate*.] A salt of silicic acid. Silicates formed by the union of silicic acid with the bases alumina, lime, magnesia, potassa, soda, etc., constitute by far the greater number of the minerals which compose the crust of the globe. Glass is a mixture of artificial silicates of alkalis and alkaline earths or metallic oxides (see *glass*).—**Silicate cotton**. See *cotton*.

All the existing horny or fibrous sponges are supposed to have been derived from *Silicea* which have lost their spicules, or replaced them by a fibrous skeletal support. The *Silicea*, as a subclass of *Spongia*, are divided by Von Lendenfeld into three orders—*Hexactinellida*, *Chondrospongia*, and *Cornacuspungia*.

siliceous, *a.* See *silicious*.

silicic (sil'is-ik), *a.* [*< NL. silica* + *-ic*.] Of or pertaining to silica: as, *silicic ether*.—**Silicic acid**, an acid obtained by decomposing a silicate soluble in water with hydrochloric acid, and dialyzing the liquid so obtained. The acid is a colloid, and is obtained in an aqueous solution, which if concentrated sets to a jelly. Silicic acid has not yet been obtained in the pure form, as it undergoes decomposition into water and silica when dried. There are several hypothetical silicic acids, from which the several classes of silicates are supposed to be formed. Such are orthosilicic acid (H₄SiO₄), metasilicic acid (H₂SiO₃), and parasilicic acid (H₆SiO₇). None of these acids has been isolated.—**Silicic ether**, a compound of silicic acid with an alkyl, as methyl silicate ((CH₃)₄SiO₄).

In the widest sense the *Silicispongiae* include all non-calcareous sponges, whether silicious spicules are present or not, and are the same as *Silicea*, 2. In Sollas's classification the term is restricted to *Micro-mastixia* having a skeleton the scleres of which are not calcareous, being thus the silicious sponges without the *Myxospongiae*. Also *Silicispongiae*. See cuts under *Porifera* and *Spongylla*.

Also *silicula*, *silicule*.

silicon (sil'i-kon), *n.* [< NL. *silicon*, < L. *silix* (*silic-*), flint: see *silix*, *silica*.] Chemical symbol, Si; atomic weight, 28.19. A non-metallic element which is obtained in three allotropic forms—namely, amorphous, as a dull-brown powder soluble in alkali, which burns when ignited; graphitic, in crystalline leaves having a strong metallic luster and lead-gray color, insoluble in alkali and non-combustible; and crystalline, in octahedral needles having a red luster, and hardness a little less than that of the diamond. Next to oxygen, silicon is the most abundant element in nature. It is found only in combination, chiefly with oxygen, forming silicon dioxide, or silica, which combined with bases makes up the larger part of the rock-crust of the globe. Also called *silicium*.—**Silicon-brass**, brass prepared with the addition of a small amount of silicon, by which its valuable qualities are said to be improved.—**Silicon-bronze**, copper prepared with the addition of a small amount of silicon-copper, by which its valuable properties for certain uses, as for telegraph-wire, are said to be considerably improved. Weiller's silicon-bronze telegraph-wire was found by analysis to consist of almost chemically pure copper, with 0.02 per cent. of silicon. The silicon-bronze telephone-wire of the same maker contained 1.02 per cent. of zinc, 1.14 of tin, and 0.05 of silicon. The addition of the silicon in the manufacture of silicon-bronze seems to have no other effect than that of entirely removing the oxygen of the copper.—**Silicon-iron**, iron containing a large proportion of silicon (as much, in some instances, as 10 to 14 per cent.), prepared for use in improving the quality of cast-iron, especially for foundry use,

which it is now believed to do by its action on the carbon which the iron contains, an increase of silicon changing combined carbon to graphitic, and vice versa. Also called *high-silicon iron*, and, of late more generally, *ferro-silicon*. "When the founder understands its [silicon's] use, he may soften and toughen, or harden and strengthen his iron to suit his requirements." (*Keep and Orton*, Trans. Amer. Inst. Min. Eng. (1888-9), XVII. 253.)—**Silicon ware**, a kind of stoneware introduced about 1883 by the Lambeth potteries: it is colored in the body, very slightly glazed, and somewhat resembles Wedgwood ware in surface and coloring.

The Chinese name for silk is *szē*, *szū*, *sz'*, with variants *sei*, *si*, whence Corean *sa*, *sil*, *sir*, Mongol *sereg*, *silk*, < se (< Chinese *szē*, *sei*) + *-reg*, a suffix of Tatar languages. The Chinese word is prob. not connected with the European, except that the Gr. *Σήρες* may mean the Chinese, and be based on the Chinese name for silk. For the more common Teut. word for 'silk,' see *say*.] **I. n. 1.** A fine soft thread produced chiefly by the larvæ of various bombycid moths, especially of *Bombyx* (*Serica*) *mori*, known as *silkworms*, feeding on the leaves of the mulberry and several other trees. (See *Bombyx* and *silkworm*, and compare *gut*, 4.) **silk** is the strongest, most lustrous, and most valuable of textile fibers. The thread is composed of several finer threads drawn by the worm from two large organs or glands containing a viscid substance, which extend, as in other cocoon-making caterpillars, along a great part of the body and terminate in two spinnerets at the mouth. With this substance the silkworm envelops itself, forming its cocoon. *Rare silk* is produced by the operation of winding off at the same time several of these cocoons, after they have been immersed in hot water to soften the natural gum on the filament, on a common reel, thereby forming one smooth, even thread. Before it is fit for weaving it is converted into one of three forms, namely *singles*, *tram*, or *organzine*. *Singles* (a collective noun) is formed of one of the reeled threads, twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together, and is commonly used in weaving as the *shoot* or *weft*. (For *organzine*, see *thrown silk*, below.) **Silk** of various qualities (but none fully equal to the preceding) is produced by different genera of the family *Saturniidae*, particularly the tusser-worm of India, *Attacus mytila*, the yama-mal of Japan, *Antheraea yama-mai*, etc., feeding on the oak and other plants. **2.** A similar thread or fiber spun by various other insects, especially some spiders; a kind of cobweb or gossamer. Some such webs are lustrous, and may be reeled like true silk. See *Nephila*, and cut under *silk-spider*.—**3.** Cloth made of silk; by extension, a garment made of such cloth. In this sense the word has a plural, *silks*, denoting different sorts or varieties: as, *black silk*; *white silk*; *colored silks*.

silo (si'lō), *n.* [= *F. silo*, < *Sp. silo*, *silo*, < *L. silus*, < *Gr. σῖλος, σείρος*, a pit to keep corn in, an underground granary, a pitfall.] A pit or chamber in the ground, or a cavity in a rock, or more rarely a warm air-tight structure above ground, for the storing of green crops for future use as fodder in the state called *ensilage*. The material is tightly packed in the silo soon after it is gathered (sometimes with addition of a little salt), covered, and pressed down with heavy weights. Thus it is subjected to fermentation, which, if not carried too far, is beneficial rather than injurious. The resulting fodder is analogous in its nutritious quality to sauerkraut, which is the product of fermentation of cabbage. Similar pits or cavities in the ground or in rock have been used from remote times, in various parts of the world, for the prolonged preservation of grain in a dry state, through the careful exclusion of air and moisture.

The genus is wide-spread, but contains less than 100 species, of which 10 inhabit the United States. *S. opaca* of Europe feeds to an injurious extent upon the leaves of the beet and mangel-wurzel. *S. inaequalis* is a North American species.

These beetles are often of considerable size, and live mainly upon carrion, a few upon decaying or living vegetation. Some are found in the nests of ants, mice, and bees, while others inhabit caves. The family is of universal distribution, and about 500 species have been described, of which about 100 are from America north of Mexico. Also *Silphæ*, *Silphææ*, *Silphidae*, *Silphida*, *Silphides*, *Silphina*, and *Silphites*. See cuts under *Silpha*, *burying-beetle*, and *sexton-beetle*.

silphium (sil'fi-um), *n.* [L., < *Gr. σίλφιον*, a plant (see def. 1), so called in allusion to its resinous juice; cf. *hay-plant* and *Thapsia*.] 1. An umbelliferous plant the juice of which was used by the ancient Greeks as a food and medicine: called in Latin *laserpitium*. (See *laser*, *laserpitium*.) It has been variously identified, as with *Thapsia Garganica*.—2. [*cap.*] [NL. (Linnaeus, 1752).] A genus of composite plants, of the tribe *Helianthoidæ* and subtribe *Melampodiæ*. It is distinguished by its large flower-heads with a broad involucre, sterile disk-flowers, and pistillate and fertile strap-shaped ray-flowers in one or two rows, producing compressed achenes bordered by two wings which are toothed or awned at the apex. Twenty species have been described, of which eleven are now considered distinct. They are all natives of the United States, chiefly in the Mississippi valley and Southern States. They are tall rough-hairy perennials, with a resinous juice, bearing alternate, opposite, or whorled leaves of various shapes, and either entire, toothed, or lobed. The yellow flowers (in one species the rays are white) are borne in long-stalked heads, which are solitary or loosely corymbose. *S. terebinthaceum*, remarkable for its odor of turpentine, is the prairie-dock of the west. For *S. perfoliatum*, see *cup-plant*; and for *S. laciniatum*, see *robin-weed* and *compass-plant*.

Thus, the characteristics of prototypembryos, derived from the adults of a common more or less remote stock of the same division of the animal kingdom, are matters of *silphology*. *Huall*.

silt (silt), *n.* [ME. *silte*, erroneously *cilte*; with formative *-t*, < *silen*, drain, filter, strain; see *sile*.] A deposit of mud or fine soil from running or standing water; fine earthy sediment: as, a harbor choked up with *silt*.

See cut under *Siluridae*.

Silurian (si-lū'ri-an), *a.* and *n.* [*< L. Silures* (Gr. Σῖλοι), the Silures (see def. I., 1), + *-ian*.] I. *a.* 1. Of or belonging to the Silures, a people of ancient Britain, or their country.—2. In *geol.*, of or pertaining to the Silurian. See II.

II. *n.* A name given by Murchison, in 1835, to a series of rocks the order of succession of which was first worked out by him in that part of England and Wales which was formerly inhabited by the Silures. The various groups of fossiliferous rocks included in the Silurian had, previous to Murchison's labors, been classed together as one assemblage, and called by the Germans *grauwacke*, sometimes Anglicized into *graywacke* (which see), also the *Transition series* or *Transition limestone*. In England and Germany these lower rocks have been greatly disturbed and metamorphosed, and have also been frequently invaded by eruptive masses; hence it was not until after considerable progress had been made toward a knowledge of the sequence of the higher fossiliferous groups that the lower (now designated as *Silurian* and *Devonian*) began to be studied with success. Almost contemporaneously with the working out of the order of succession of these lower rocks by Murchison in Great Britain, groups of strata of the same geological age, but lying for the most part in almost entirely undisturbed position, began to be investigated on and near the Atlantic coast of the United States, especially in New York, by the Geological Survey of that State, and a little later in Bohemia by Joachim Barrande. Murchison, Barrande, and James Hall, paleontologist of the New York Survey, are all agreed as to the adoption of the name *Silurian*, and in regard to the essential unity of the series or system thus designated. The Silurian is the lowest of the four great subdivisions of the Paleozoic, namely

Silurian, Devonian, Carboniferous, and Permian. When undisturbed and unmetamorphosed, the Silurian is usually found to be replete with the remains of organic forms, of which by far the larger part is marine. The Silurian is divided into an Upper and a Lower Silurian, and each of these again is subdivided into groups and subgroups varying in nomenclature in various countries. The line between the Upper and Lower Silurian is drawn in Great Britain at the top of the May Hill sandstone or Upper Llandovery group; in New York, at the top of the Hudson River or Cincinnati group. The almost entire absence of vertebrates and of land-plants, and the paucity of plant-life in general, are the most striking features of Silurian life. The most prominent forms of the animal kingdom were the graptolites, trilobites, and brachiopods, and of these the first-mentioned are the most characteristic of all, since they range through nearly the whole Silurian, and disappear in the Devonian; while the trilobites, which begin at the same time with the graptolites, continue through the Devonian, and end only with the Carboniferous. As the line between the Silurian and Devonian is commonly drawn in England—namely, so as to include in the former the Ludlow group—the first vertebrates, in the form of a low type of fishes, appear near the top of the Upper Silurian; traces of land-animals (scorpions) have also been found in the Upper Silurian of Sweden and Scotland; and in France, in the Lower (?) Silurian, traces of insect life. A scorpion has also been found in the United States, at Waterville, New York, in the Waterlime group, or near the middle of the Upper Silurian. Mr. Whitfield, by whom the specimen was described, inclines to the opinion that the species, for which he instituted a new genus (*Proscorpius*), was aquatic and not air-breathing, and that it forms a link between the true aquatic forms like *Eurypterus* and *Pterygotus* and the true air-breathing scorpions of subsequent periods. He intimates that the same is likely to be true of the Swedish and Scottish Silurian scorpions. The traces of land-plants in the Silurian are rare, and for the most part of doubtful identification. Algae, on the other hand, are of somewhat frequent occurrence. As the line between Silurian and Devonian is drawn in the United States—namely, between the Oriskany sandstone and the Canda-gall grit—there are neither land-animals nor fishes in the Silurian; and the evidence of the existence of land-plants lower than the Devonian is for the most part of a very doubtful character. The Silurian rocks are widely spread over the globe, with everywhere essentially the same types of animal life. This part of the series is of importance in the United States, especially in the northeastern Atlantic States and in parts of the Mississippi valley.

Siluric (si-lū'rik), *a.* [*< L. Silures* (see *Silurian*) + *-ic*.] Same as *Silurian*. [Rare.]

silurid (si-lū'rid), *a.* and *n.* Same as *siluroid*.

Siluridae (si-lū'ri-dē), *n. pl.* [NL., < *Silurus* + *-idae*.] A very large family of physostomous fishes, of the order *Nematognathi*, represented by such forms as the sheat-fish of Europe and the catfishes or cats of America. It was the same as *Siluroides* of Cuvier. By Cope its name was used for *Nematognathi* with the anterior vertebrae regularly modified, the inferior pharyngeal bones separate, and an operculum developed. It thus contrasted with the *Apredinidae* and *Hypophthalmidae*, and included all the *Nematognathi* except those belonging to the two families named. By Gill the family was restricted to those *Nematognathi* which have the anterior vertebrae regularly modified; the lower pharyngeal bones separate; the operculum developed; a dorsal fin, in connection with the abdominal portion of the vertebral column, rather short, and preceded by the spine; the pectoral fins armed with well-developed spines having a complex articulation with the shoulder-girdle; and the body naked, or with plates only along the lateral line. The lower jaw has no reflected lip, and there are usually from four to eight pairs of barbels, maxillary barbels being always developed. Species of the family thus limited are very numerous, several hundred having been described, and referred to many genera. Most of them inhabit fresh water, especially of tropical and subtropical countries, but many are also found in tropical seas. In Europe, one, the sheat-fish, *Silurus glanis*, oc-

curs in the central and eastern regions of the continent; while a second, more southerly, and supposed to be the glanis of the ancients, has lately (1890) been distinguished as *Silurus (Parasilurus) aridolus*. In North America the family is represented by a number of species belonging to different subfamilies, which are generally known under the name of *catfishes*. The leading genera of North America are *Noturus*, stone-cats; *Ambloplites*, ordinary cats, pouts, bullheads, etc.; *Ictalurus*, channel-cats; *Arius*, sea-cats; and *Aleurichthys* (or *Felichthys*), gaff-top-sails. See also cuts under *catfish*, *gaff-top-sail*, *pout*, and *stone-cat*.

Some attempt to connect *silver* with L. *sulfur*, sulphur (see *sulphur*), others with Gr. *αἰδύρος*, iron.] I. *n.* 1. Chemical symbol, Ag; atomic weight, 107.9. A metal of a white color, having a specific gravity of 10.4 to 10.7 (according as it is cast, rolled, or hammered), harder than gold, and softer than copper, having a tenacity about equal to that of gold, and melting at a temperature a little lower than copper. Its whiteness is remarkable, that of tin alone among the common metals nearly approaching it; among the rare metals, iridium and lithium are equal to silver in color and luster. Silver crystallizes in the regular (isometric) system; but, although native silver is of frequent occurrence, distinct crystals are very rare. Arborescent and filiform shapes are most common, but very large solid masses have been found. Silver occurs in a great variety of ores, being mineralized by sulphur, antimony, and arsenic, as well as by chlorine, iodine, and bromine. These ores are widely distributed over the world. Silver is very commonly associated with lead; and the common ore of the latter metal, galena, always contains some silver, and generally enough to make its separation remunerative. Silver has also been detected in the water of the ocean. The principal silver-producing regions are the Andes and Cordilleras. From Peru and Bolivia came an immense supply of this metal during the sixteenth and seventeenth centuries. Mexico has been a large producer of silver since the middle of the sixteenth century. The mines of the Comstock lode at Virginia City, in Nevada, produced about \$320,000,000 worth of bullion from 1860 to 1890, about five twelfths of the value of which was silver. This metal has always been accounted "precious," and has been used for ornament and as a measure of value from the earliest times of which there is any historical record. Its most marked point of inferiority to gold, apart from color, is its liability to tarnish when exposed to sulphurous emanations or brought into contact with anything containing sulphur. Silver is too soft to be used in the unalloyed condition. The ratio of silver to copper in the silver coinage of England is 92½ to 7½ (or 12½ to 1); in that of France and the United States, 90 to 10; and in that of Prussia, 3 to 1.

2. Silver coin; hence, money in general.

The relative proportions of the metals in the alloy called German silver vary considerably, according to the desire of the manufacturer to produce a cheaper or more expensive article. The commonest kind contains about eight parts of copper, two of nickel, and three to five of zinc. A finer kind of alloy is obtained by adding more nickel; the metal is then less liable to tarnish, and the resemblance to silver in color and luster is more striking. Nickel is a much more expensive metal than copper, and very much more so than zinc. See *nickel*.—**King's silver**. (a) A name given to silver used in England from about 1700 to 1720 for plate of an unusually high standard; apparently introduced by workmen from the continent, and abandoned because not sufficiently hard and durable. The silver fir of the Alleghany region, etc., is *A. balsamea*, mostly called *balsam* or *balm of Gilead* fir. It is a moderate sized tree, its twigs sought for scented cushions, its bark secreting Canada balsam (see *balsam*), also the source of spruce-gum. Pacific North America presents several noble silver firs, as *A. grandis*, the white fir of Oregon bottom-lands, and *A. nobilis* and *A. magnifica*, the red firs of the mountains of Oregon and California, all trees between 200 and 300 feet in height.—**Silver fox**, the common red fox, *Vulpes vulpes*, in a melanistic variation, in which the pelage is black or blackish, overlaid with hoary or silver-gray ends of the longer hairs. It is an extreme case of the range of variation from the normal color, of which the cross-fox is one stage. It occurs in the red foxes of both America and Europe, especially in high latitudes, and constitutes the *Canis* or *Vulpes argentatus* or *argenteus* of various authors. The silver fox has sometimes been defined wrongly as a variety of the gray fox of the United States (*Urocyon cinereo-argentatus*), perhaps by some misapprehension of Schreber's (1778) specific name, just cited; but this is a distinct species of a different genus, and one in which the silver-black variation is not known to occur. Compare cut under *cross-fox*.

While the Cross and Black and *Silver Foxes* are usually considered as different varieties, they are not such in the classificatory sense of that term, any more than are the red, black, or white wolves, the black marmots, squirrels, etc. The proof of this is in the fact that one or both of the "varieties" occur in the same litter of whelps from normally colored parents. They have no special distribution, although, on the whole, both kinds are rather northerly than otherwise, the *Silver Fox* especially so.

It is characterized by dioecious flowers with a small five-lobed calyx, five petals surrounding a hemispherical and villous disk which bears ten stamens, or a deeply five-parted ovary with a single short style, a broad five-lobed stigma, and five solitary ovules. It is closely allied to the well-known genus *Alantus*, but distinguished by a fruit of one to five sessile spreading drupes instead of as many thin wing-fruits. There are 3 or 4 species, natives of eastern parts of tropical America, for which see *mountain-damson*, *Quassia*, *paraiba*, and *paradietree*. They bear alternate and abruptly pinnate leaves, with entire coriaceous leaflets, and small flowers in axillary and terminal elongated branching panicles.

Branch of *Simaruba amara*, with female flowers. *a*, a male flower; *b*, a female flower.

Simarubaceæ (sim'ā-rō-bā'sē-ē), *n. pl.* [NL. (L. C. Richard, 1808), *< Simaruba + -aceæ*.] An order of polypetalous trees, of the cohort *Gera-niales* in the series *Discifloræ*, closely allied to the order *Rutaceæ*, from which it is distinguished by the usual presence of alternate leaves without glands, stamens each augmented by one or more scales, and but a single ovule in each ovary-cell. It includes about 112 species, of about 30 genera, mainly natives of warm climates, and classed in the two tribes *Simarubæ* and *Pieramnieæ*. They are mostly odorless trees or shrubs, with a bitter bark, alternate pinnate leaves without stipules, and usually small flowers, commonly axillary, panicled or racemed. They are deep-sea forms parasitic upon other fishes. The form is shorter and more robust than in the common eels, but the scales are distributed in the same manner. The head ends in a short and blunt snout, and the lower jaw is deep and strong. The teeth are blunt, incisor-like, and in one row on the edge of the jaws. Only one species is known, *S. parasiticus*, which is found in deep water, and is prone to attack fishes that have been hooked, especially the halibut, into whose flesh it burrows. It is very abundant on the banks south of Newfoundland. **Simenchelys** (si-meng-ke-li-s), *n.* [NL., < Gr. *σινος*, snub-nosed, flat-nosed, + *ἐχέλυς*, *ἐχέλις*, an eel.] The representative genus of *Simenchelyidae*, having scales like those of the com-

The form is more nearly human than that of any other animal below man. The carriage is semi-erect, or capable of becoming so; the arms are much longer than the legs; the tail is rudimentary (in the gorilla with fewer vertebrae than in man); the sacrum is large and solid; the sternum is short and broad, with three or four intermediate sternbrae; and the spinal column has a slight sigmoid curve, giving a "small of the back" somewhat as in man; the teeth are thirty-two, with the same formula as in man; and the nose is cartilaginous, as in the rest of the Old World apes. Having characteristics in common; like in form, appearance, size, qualities, relations, etc.; having a more or less marked resemblance to each other or one another; in some respects identical; bearing a resemblance, as to something implied or specified: as, the general features of the two landscapes are *similar*; the plans are *similar*.

A captious question, sir (and yours is one),

Deserves an answer *similar*, or none.

Boyle, Works, I. 206.

3. [Tr. Gr. *ὁμοιος*.] In *geom.*, of the same shape: said of two figures which have all their corresponding angles equal, whence it will follow, for ordinary Euclidean space, that all their corresponding lengths will be proportional, that their corresponding areas will be in the duplicate ratio of their lengths, and that their corresponding volumes will be in the triplicate ratio of their lengths. In the non-Euclidean systems of geometry these consequences are falsified, so that there are no similar figures.

Similar solid figures are such as have their solid angles equal, each to each, and are contained by the same number of *similar* planes. *Euclid's Elements*, Bk. xi. def. xi.

4. In *biol.*, alike in some respects; identical to some extent. Specifically—(a) Having the like structure: of common origin; homologous (which see). (b) Having the like function or use, though of unlike origin; analogous (which see). These two senses are respectively the morphological and the physiological application of the word to parts or organs of animals and plants.

All [the Indian names are] more flexible on the tongue than their Spanish *similars*. *Scribner's Mag.*, II. 505.

The law of similars. (a) The law of mental association by which similar ideas are connected in the mind and suggest one another. This kind of association is denied by some psychologists, who forget that without it *similarity* would have no possible meaning. When we say that today's idea is like yesterday's, we can only mean that a sense of affinity connects them. The kind of association is the essential condition of generalization. (b) The homeopathic principle of administering drugs. See *similia*.

In Argument

Similies are like Songs in Love:

They much describe; they nothing prove.

Prior, Alma, iii.

= *Syn.* *Simile*, *Metaphor*, *Comparison*, *Allegory*, *Parable*, *Fable*, *similitude*, *trope*. The first six words agree in implying or expressing likeness between a main person or thing and a subordinate one. *Simile* is a statement of the likeness in literal terms: as, man is like grass; Herod is like a fox. *Metaphor* taxes the imagination by saying that the first object is the second, or by speaking as though it were: as, "All flesh is grass," Isa. xl. 6; "Go ye and tell that fox," Luke xiii. 32. There are various combinations of *simile* and *metaphor*: as, "We all do fade as a leaf," Isa. lxxv. 6;

"There are a sort of men whose visages
Do cream and mantle, like a standing pool"

(*Shak.*, M. of V., I. 1. 89).

In these the *metaphor* precedes; in the following the *simile* is in the middle of the *metaphor*: "These metaphysic rights, entering into common life, like rays of light which pierce into a dense medium, are, by the laws of Nature, refracted from their straight line." (*Burke*, Rev. in France.) In the same way the *simile* may come first. A *comparison* differs from a *simile* essentially in that the former fixes attention upon the subordinate object, while a *simile* fixes it upon the main one: thus, one verse of Shelley's "Ode to the Skylark" begins by saying that the skylark is like a poet, whose circumstances are thereupon detailed. Generally, on this account, the *comparison* is longer than the *simile*. The *allegory* personifies abstract things, usually at some length. A short *allegory* is Ps. lxxx. 8–16. Spenser's "Faery Queene" is a series of *allegories* upon the virtues, and Bunyan's "Pilgrim's Progress" allegorizes Christian experiences. These are acknowledged to be the most perfect *allegories* in literature. The *allegory* is an extended *simile*, with the first object in the *simile* carefully left unmentioned. A *parable* is a story that is or might be true, and is used generally to teach some moral or religious truth: as, the three *parables* of God's great love for the sinner in Luke xv. Socrates' story of the sailors who chose their steersman by lot, as suggesting the folly of a similar course in choosing the helmsman of the state, is a fine example of the *parable* of civil life. A *fable* differs from a *parable* in being improbable or impossible as fact, as in making trees choose a king, beasts talk, or frogs pray to Jupiter; it generally is short, and points a homely moral. See the definitions of *apologue* and *trope*.

simile (sim'i-lē), *adv.* [It., < L. *simile*, *similis*, like: see *similar*, *simile*, *n.*] In *music*, in the same manner; similarly. Compare *scmpre*.

similia (si-mil'i-ā), *n. pl.* [NL. neut. pl. of L. *similis*, like: see *similar*.] Things which are similar or alike; like things; similars.—**Similia similibus curantur**, or 'like cures like,' 'like things are cured by like things,' the homeopathic formula, meaning that medicines cure those diseases whose symptoms are like the effects of the medicines on the healthy organism. Thus, belladonna dilates the pupil of the eye; it is therefore remedial of diseases of which dilatation of the pupil is pathognomonic.

similiter (si-mil'i-tēr), *adv.* [L., < *similis*, like, resembling.] In like manner: in *law*, the technical designation of the common-law form by which, when the pleading of one party, tendering an issue, demanded trial, the other accepted the issue by saying, "and the [defendant] doeth the like."

2. Specifically—(a) In *phonology*, imitation in form; the alteration of the form of a word so as to approach or agree with that of another word having some accidental similarity, and to suggest a connection between them: a tendency of popular etymology. Simulation. The feigning a connection with words of similar sound is an important fact in English and other modern languages: *asparagus* > *sparrow-grass*. It probably had just as full play in ancient speech, but its effects cannot be so surely traced.

Dan. *synð* (not in Goth.), *sin*, akin to *L. son* (> *s*), *sinful*, *guilty*, *soniticus*, dangerous, hurtful, and perhaps to Gr. *σῆν*, *sin*, mischief, harm. According to Curtius and others, the word is an abstract noun formed from the ppr. represented by *L. sen* (> *s*), *en* (> *s*), being, and by AS. *sōth*, true, sooth, = Icel. *sannr*, etc., lit. 'being (so)' (see *sooth*), Goth. *sunja*, the truth, sooth.] **1.** Any want of conformity unto or transgression of the law of God. (*Westminster Assembly's Shorter Catechism*.) The true definition of sin is a much contested question, theologians being broadly divided into two schools of thought, the one holding that all sin consists in the voluntary and conscious act of the individual, the other that it also includes the moral character and disposition of the race; one that all moral responsibility is individual, the other that there is also a moral responsibility of the race as a race. To these should be added a third school, which regards sin as simply an imperfection and immaturity, and therefore requiring for remedy principally a healthful development under favorable conditions. Theologians also divide sin into two classes, *actual sin* and *original sin*. Actual sin consists in the voluntary conscious act of the individual. (See *actual*.) Original sin is the innate depravity and corruption of the nature common to all mankind. But whether this native depravity is properly called *sin*, or whether it is only a tendency to sin and becomes sin only when it is yielded to by the conscious voluntary act of the individual, is a question upon which theologians differ. Roman Catholic and other theologians, following the early church fathers, distinguish between *mortal* (or *deadly*) and *venial* sins. Mortal or deadly sins are such as willfully violate the divine law, destroy the friendship of God, and cause the death of the soul. The seven mortal or deadly sins are pride, covetousness, lust, anger, gluttony, envy, and sloth. Venial sins are such transgressions as are due to inadvertence, do not destroy the friendship of God, and, while tending to become mortal, are not in themselves the death of the soul. The difference is one of degree, not of kind.

And ye knowe also that it was do be me, and so sholde myn be the *synne*.
Merrin (E. E. T. S.), I. 80.

Sure, it is no *sin*;
Or of the deadly seven it is the least.

= **Syn.** 3. Because, *Since*, As, Inasmuch as, For. Inasmuch as is the most formal and emphatic, being used only to mark

the express reason or condition. For follows the main proposition, and generally introduces that which is really continuative of the main proposition and of equal or nearly equal importance, the idea of giving a reason being subordinate.

sine¹ (sin), *adv.* and *conj.* [Also *syne*, the usual spelling in Sc.; *< ME. sine*, *syne*, a later form, with added adverbial termination -e (in part a mere variant), of *sin*², contraction of *sithen*: see *sin*², *sith*.] 1. *adv.* 1. After that; afterward: same as *since*, 1.

Seyne bowes of wyld bores with the braune lechye.
Morte Arthure (E. E. T. S.), l. 188.

2. Before now; ago: same as *since*, 3: as, *lang syne*, long ago, used also as a noun, especially in the phrase *auld langsyne*, old times (see *langsyne*). [Obsolete or Scotch in both uses.]

II. *conj.* After; since: same as *since*.

Such th' Indian Gulf, and such th' Arabian Brine.
Sylvestre, tr. of Du Bartas's Weeks, l. 3.

2. In *trigon.*, formerly, with reference to any arc of a circle, the line drawn from one extremity of the arc at right angles to the diameter which passes through its other extremity; now ordinarily, with reference not to the arc but to the angle which it subtends at the center of the circle, the ratio of the aforesaid line to the radius of the circle.

Thus, in the diagram, BE is the sine of the arc AB (sometimes it is defined as half the chord of double the arc), and the ratio of BE to CB is the sine of the angle ACB. (See *trigonometrical functions*, under *trigonometrical*.) A more scientific definition of

the sine is that of Euler, $\sin x = \frac{1}{2}i(e^{-xi} - e^{xi})$, where $i^2 = -1$, and e is the Napierian base. The sine is also fully defined by the infinite series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$$

But all the properties of sines are readily deduced from the definition that the sine is such a function that it vanishes with the variable, while

$$\frac{d \sin x}{dx} = \sqrt{1 - (\sin x)^2}.$$

Abbreviated *sin*, as in formulae here given. — **Arithmetic of sines**, analytical trigonometry. Its object is to exhibit the relation of the sines, cosines, tangents, etc., of arcs, multiple arcs, etc. — **Artificial sine**. See *artificial*. — **Co-versed sine**, the versed sine of the complement of an angle. In the diagram the ratio of DK to BC is the co-versed sine of the angle ACB; and DK is the co-versed sine of the arc AB. — **Curve of sines**. See *curve*. — **Lines of sines**, a scale having divisions marked with values of an angle in arithmetical progression, the distances of the divisions from the origin being proportional to the sines of these angular values. — **Logarithmic sine**, the logarithm of a natural sine. — **Natural sine**, the sine as above defined: the expression arose when *sine* was still understood as a half-chord, and meant the sine for radius unity (or some multiple of ten). — **Sine galvanometer**. See *galvanometer*. — **Sine of the (m-1)th order**, the function expressed by the series

$$\frac{x^{2m-1}}{(m-1)!} \pm \frac{x^{2m-1}}{(2m-1)!} + \frac{x^{2m-1}}{(3m-1)!} \pm \dots$$

These functions were invented by Wronski. — **Sine of three lines which meet in a point**, the sine of the angle between the first line and the plane of the other two, multiplied by the sine of the angle between the other two lines. — **Sine of three planes**, the sine of the angle between the first plane and the intersection of the other two, multiplied by the sine of the angle between the other two planes. — **Subversed sine**. Same as *supplemental versed sine*. — **Supplemental versed sine**, the difference between the versed sine and the diameter. — **Versed sine**, unity minus the cosine. Formerly, for the arc AB (see the diagram), it was understood to be the line EA: now the ratio of EA to BC is the versed sine of the angle ACB. — **Whole sine of a circle**, the radius.

The manner [in the County of Hereford] was that, when the Corps was brought out of the house and layd on the Bier, a Loafe of bread was brought out, and delivered to the *Sine-eater* over the corps, as also a Mazar-bowle of maple (Gossips bowle) full of beer, wch he was to drinke up, and sixpence in money, in consideration whereof he tooke upon him (ipso facto) all the Sinnes of the Defunct, and freed him (or her) from walking after they were dead. *Aubrey*, *Remaines of Gentilisme*, p. 35 (Folk-Lore Soc. 3. In *math.*, an exceptional element or character of a continuum. (a) In *geom.*, a projective character of a locus consisting in certain points, lines, or planes being exceptional in their relations to it. (For examples, see *binode*.) An ordinary singularity is one of a set of singularities of which all others are modifications or compounds. Thus, an actual node upon a skew curve is a modification of an apparent node, and ought not to be reckoned as an ordinary singularity. But cusps and inflections, as stationary points and tangents, are ordinary singularities. A higher singularity is one which differs indefinitely little from an aggregation of ordinary singularities. (See *catenode*.) By an ellipsis common in geometrical language, the word *singularity* is used for *point-singularity*, or a relation to some exceptional point. Thus, a plane curve with neither nodes nor cusps is said to be without singularities, although, unless a conic, it has inflections, and unless a conic or cubic, double tangents. The word *singularity* is also used to denote the number of singular points, lines, or planes of any one kind; also for any number characteristic of a projective property, in which sense the order, class, and rank of a locus are sometimes termed *singularities*. (b) In the theory of functions, a property of a function consisting in it or its differential coefficient becoming discontinuous for a certain value or connected system of values of the variable. — **Elliptic, essential, hyperbolic singularity.** See the adjectives. — **Simple singularity**, a singularity of a function consisting in it or its differential coefficient becoming ambiguous or discontinuous at an isolated point or points, while remaining unambiguous and continuous at all other points sufficiently near to these. — **Syn. 1.** Uncommonness, oddness. — **2.** Idiosyncrasy. See *eccentric*.

Siphneus (sif'nē-us), *n.* [NL. (Brants, 1827), < Gr. *σῖφνεις*, a mole.] 1. The typical genus of *Siphneine*. *S. armandi* is a Tibetan species with large fossorial fore feet and a mole-like aspect. — 2†. A genus of reptiles. *Fitzinger*, 1843.

siphon (si'fon), *n.* [Also *syphon*; < F. *siphon* = Sp. *sifon* = Pg. *sifão* = It. *sifone*, < L. *siphon* (n-), perhaps < Gr. *σῖφω*, a tube, pipe, siphon; akin to *σῖφός*, hollow.] 1. A bent pipe or tube with legs of unequal length, used for drawing liquid out of a vessel by causing it to rise in the tube over the rim or top. For this purpose the shorter leg is inserted in the liquid, and the air is exhausted by being drawn through the longer leg. The liquid then rises by the pressure of the atmosphere and fills the tube, and the flow begins from the lower end. Sometimes an exhausting-tube (a in the figure) is placed on the longer leg; the air, in that case, is sucked out through a till the tube is filled to the cock b, which is then opened, and the flow commences—the cock b being so constructed as to close the suction-tube when the siphon is running. But the more general method is to fill the tube in the first place with the liquid, and then, stopping the mouth of the longer leg, to insert the shorter leg in the vessel; upon removal of the stop, the liquid will immediately begin to run. The flow depends upon the difference in vertical height of the two columns of the liquid, measured respectively from the bend of the tube to the level of the water in the vessel and to the open end of the tube. The flow ceases as soon as, by the lowering of the level in the vessel, these columns become of equal height, or when this level descends to the end of the shorter leg. The atmospheric pressure is essential to support the column of liquid from the vessel up to the top of the bend of the tube, and this height is consequently limited, varying inversely with the density of the liquid. At sea-level the maximum height is a little less than 30 inches for mercury and 34 feet for water.

with holes equidistantly arranged in a circle, which can be revolved over a jet of compressed air or steam so as to produce periodic puffs. When the revolutions are rapid enough, the puffs coalesce into a musical tone. The revolution of the disk is effected either by a motor of some kind, or by setting the holes at an oblique angle so that the impact of the jet shall do the work. In the more complicated forms of the instrument two or more tones can be produced at once, either by having two or more concentric circles of holes in the same disk, or by two separate disks: the latter form is called a *double siren*. The number of revolutions required to produce a given tone can be counted and exhibited in various ways; and the application of the instrument in acoustical experiments and demonstrations is wide. In the cut *a* is a perforated disk made to revolve by the pressure of the air forced from the bellows beneath through *d*; *b*, vertical shaft revolving with the disk, and, by means of a pair of cog-wheels in the box *c*, turning the two index-hands on their respective dial-plates, and thus registering the number of revolutions made during the time of observation. Very large sirens are sometimes made for use as fog-signals, the sound being conveyed seaward in a large trumpet-shaped tube called a *fog-horn*, a name also given to the whole arrangement. See *fog-horn*. Also *sirene*.

The brain is small and particularly narrow. The periotic and tympanic bones are ankylosed together, but not with the squamosal; the foramen magnum is posterior, directed somewhat downward; the lower jaw has a well-developed ascending ramus, a coronoid process, and an ordinary transverse condyle; and the teeth are molariform, adapted to chew herbage. The neck is moderate, and the axis has an odontoid process. The fore limbs are moderately developed, with a flexure at the elbow; the carpal, metacarpal, and phalangeal bones are directly articulated and of normal number. There are two mammae, pectoral. The heart is deeply fissured between the ventricles. (See first cut under *heart*.) In nearly all the above characters the *Sirenia* are contrasted with the *Cetacea*, which they resemble, and with which they were formerly classed as *Cetacea herbivora*. They are large or huge unwieldy and ungainly aquatic animals, inhabiting the sea-shores, bays, and estuaries of various countries, never going out to sea like cetaceans, nor ascending rivers far. They feed entirely on aquatic vegetation. There are only two living genera, *Manatus* and *Halocore*, the manatees and dugongs, representing two families, *Manatidae* and *Halocoridae*. The sea-cow, *Rhytina stelleri*, recently extinct, represents a third family, *Rhytinidae*. There are several other extinct genera, some of them constituting the family *Halitheriidae*. 2. Sisters collectively, or a society of sisters; in religious usage, an association of women who are bound by monastic vows or are otherwise devoted to religious work as a vocation. In the Roman Catholic Church the members of a sisterhood may be bound by the irrevocable vows of poverty, chastity, and obedience, and are then called *nuns*, or may be merely under one rule and bound by revocable vows. In the Church of England and its offshoots there are also sisterhoods, the members of which either take a revocable vow of obedience to the rule of their association, or live under the rule of the order without vow. Among the more important of the sisterhoods are the Sisters of Charity (see *charity*), the School Sisters of Notre Dame, the Little Sisters of the Poor, the Sisters of the Assumption, the Congregation of Sisters of Notre Dame, the Anglican Sisterhoods of St. John the Baptist, of the Holy Communion, of St. Mary, etc. The Sisters of Mercy is an order founded in 1827 in Dublin, with purposes analogous to those of the Sisters of Charity. The vows are for life. A similar sisterhood in the Church of England was founded about 1845 for assisting the poor. It consists of three orders—those who live in community actively engaged in assisting the poor, those who live in community but are engaged in devotions and other secluded occupations, and those not living in the community but assisting it as co-workers. There are also a number of somewhat similar organizations in the Episcopal Church in the United States.

It is characterized by a narrow elongated pod or silique, with the seeds commonly in one row, and the seed-leaves incumbent and straight or in a few genera convolute or transversely plicate. It includes 21 genera, of which *Sisymbrium* is the type, chiefly plants of temperate regions. See *Sisymbrium*, *Heperis*, and *Erysimum*.

Sisymbrium (si-sim'bri-um), *n.* [NL. (Tournefort, 1700), *< Gr. σισυμβριον*, a name applied to certain odorous plants, one said to be a crucifer, another *Mentha aquatica*.] A genus of cruciferous plants, type of the tribe *Sisymbrieæ*. It is characterized by annual or biennial smooth or hairy stems; flowers with free and unappendaged stamens, and a roundish and obtuse or slightly two-lobed stigma; and linear sessile pods, usually with three-nerved valves and many oblong seeds with straight cotyledons. It is destitute of the two-parted bristles found in the related genus *Erysimum*, which also differs in its linear or oblong leaves. Besides a great number of doubtful species, about 90 are recognized as distinct. They are natives especially of central and southern Europe, Siberia, and western Asia as far as India; a few are found in temperate and subarctic North America, and a very few in the southern hemisphere. They bear a stellate cluster of radical leaves, and numerous alternate stem-leaves which are usually clasping and irregularly lobed or pinnately divided. The flowers are usually borne in a loose bractless raceme, and are commonly yellow. The various species simulate the habit of many widely different genera. A few, constituting the subgenus *Arabidopsis* (A. P. de Candolle, 1821), have white, pink, or purplish flowers; two others, by some separated as a genus *Alliaria* (Adanson, 1763), have also broad or triangular heart-shaped undivided leaves, as *S. Alliaria*, the hedge-garlic. For *S. officinale*, see *hedge-mustard* (sometimes used also for any plant of the genus); for *S. Sophia*, see *herb-sophia*; and for *S. Iria*, see *London-rocket*. *S. canescens* is the tansy-mustard of the western United States, and *S. Thaliana* the mouse-ear cross of Europe, naturalized in the eastern United States.

Sisyrinchieæ (sis'i-ring-ki'ē-ē), *n. pl.* [NL. (Bentham and Hooker, 1883), *< Sisyrinchium + -æ*.] A tribe of monocotyledonous plants of the order *Iridæ*. It is characterized by commonly terminal or peduncled spathes, by concave or keeled bracts within the spathe and opposite to the two or more usually pedicelled flowers, and by style-branches alternate with the anthers or borne on a style which is longer than the stamens. It includes 26 genera, classed in 4 subtribes, of which *Crocus*, *Cipura*, *Sisyrinchium*, and *Ardea* are the types. The first, the *Crocæ*, are exceptional in their one-flowered spathes; they are largely South African and Australian. The *Cipuræ* and a few genera besides are American. The tribe includes both bulbous plants, as the *crocus*, and others with a distinct creeping or upright rootstock, which is, however, in a larger number reduced to a cluster of thickened fibers. See *Patersonia* and *Pardanthus*.

Sisyrinchium (sis-i-ring'ki-um), *n.* [NL. (Tournefort, 1700), transferred by Linnaeus from the iris; *< Gr. σισυρινχιον*, a bulbous plant, said to have been of the iris family.] A genus of plants of the order *Iridæ*, type of the tribe *Sisyrinchieæ* and of the subtribe *Eusisyrinchieæ*. It is characterized by round or two-edged stems without a bulbous base, rising from a cluster of thickened fibers; flowers with the filaments commonly partly united into a tube, and with three slender undivided style-branches; and a globose ovary which becomes an exerted capsule in fruit. There are about 50 species, all American, occurring both in the tropical and in the temperate zones, one species also indigenous in Ireland. They are tufted plants with numerous flat, long, and narrow upright leaves which are all or mostly radical, and usually a single spathe with numerous open flattish flowers. The two species of the eastern United States, *S. angustifolium* and *S. anceps*, are known as *blue-eyed grass*, from the flowers. See *rush-lily*.

In *anat.*, the dry bones of the body taken together; hence, in *anat.* and *zool.*, some or any hard part, or the set of hard parts together, which form a support, scaffold, or framework of the body, sustaining, inclosing, or protecting soft

More specifically—(a) The test, shell, lorica, or set of apicules of any protozoan, as an infusorian, radiolarian, foraminifer, or other animalcule, exhibiting the utmost diversity of form, structure, and substance. See cuts under *Foraminifera*, *Infusoria*, and *Radiolaria*. (b) In sponges, the whole sponge except the animalcules which fabricate it. (See cut under *Porifera*.) A bath-sponge, for example, is only the skeleton, from which the animals have been decomposed and displaced. This skeleton presents itself in three principal textures, the fibrous, chalky, and glassy. In a few cases it is gelatinous. (See *Fibrospongia*, *Calcispongia*, *Silicispongia*, *Myxospongia*.) A nearly constant and very characteristic feature of sponge-skeletons is the presence of calcareous or silicious apicules. (See *apicule*.) Spicules in excess of fibrous tissue, and especially when consolidated in a kind of network, form the glass-sponges, some forms of which are very beautiful. (See cut under *Euplectella*.) Certain minute scleres of some sponges are flesh-apicules, and belong to the individual sponge-animalcules rather than to the general sponge-tissue. (Compare *microscleres* with *megasccleres*.) (c) The special or general hard parts of echinoderms, as the shell of a sea-urchin with its spines and oral armature; the spicules or scleres in the integument of a holothurian; the rigid parts of starfishes, crinoids, and the like. fishes the whole skeleton is cartilaginous. In most vertebrates, however, the cartilage forming the skeleton of the embryo or fetus is mainly converted into bone by the process of ossification, or deposition of bone-earth, some parts, especially of the ribs, remaining as a rule cartilaginous. The vertebrate endoskeleton consists of axial parts, the *axial skeleton*, in a series of consecutive segments, the vertebrae, with their immediate offshoots, as ribs, and at the head end a skull or cranium (except in the *Acrania* or lowest fishes); and of appendages, the *appendicular skeleton*, represented by the one or two (never more) pairs of limbs, if any, including the pectoral and pelvic arch, or shoulder- and hip-girdle, by means of which the limbs are attached to the axis or trunk. Various other ossifications may be and usually are developed in

tendinous or ligamentous tissue, or in viscera, and constitute the *sclerkeleton* or *splanchnoskeleton*. Teeth are certainly skeletal parts, though not usually counted with

the bones of the skeleton; they are horny, not osseous or dentinal, in some animals. The human skeleton consists of about 200 bones, without counting the teeth—the enumeration varying somewhat according as the sclerkeleton, sesamoid bones are or are not included. See *sesamoid*. (2) The external covering of the body; the cuticle or epidermis; the dermo-skeleton or exoskeleton, including all the non-vascular, non-nervous cuticular or epidermal structures, as horns, hoofs, claws, nails, hairs, feathers, scales, etc. In man the exoskeleton is very slight, consisting only of cuticle, nails, and hair; but in many vertebrates it is highly developed and may be bony, as in the shells of armadillos and of turtles, the plates, shields, or bucklers of various reptiles and fishes, etc. See also cuts under *archipterygium*, *carapace*, *Catarrhina*, *elasmobranch*, *Elephantine*, *endoskeleton*, *epipterygia*, *Equisetum*, *fish*, *Ichthyornis*, *Ichthyosaurus*, *Ichthyosaurus*, *Mastodonte*, *Mytilodon*, *ox*, *Plesiosaurus*, *pterosaure*, *Pteropodidae*; also cuts under *skull*, and others there named.

marauders during the revolutionary war, professedly belonging to the American side, who infested the region between the British and American lines in New York, and committed depredations, especially upon the loyalists. [Slang.]

This poor opinion of the *Skinner* was not confined to Mr. Caesar Thompson. . . . Skip, Trip, Hop, Leap, Bound, Spring, Jump, Vault.* *Skipping* is more than *tripping* and less than *leaping*, *bounding*, *springing*, or *jumping*; like *tripping*, it implies lightness of spirits or joy. It is about equal to *hopping*, but *hopping* is rather heavy and generally upon one foot or with the feet together, while *skipping* uses the feet separately or one after the other. A *hop* is shorter than a *jump*, and a *jump* than a *leap*: as, the *hop* of a toad; the *jump* of a frog; the *leap* of a marsh-frog; a *jump* from a fence; a *leap* from a second-story window. *Skip, trip, bound, and spring* imply elasticity; *bound, spring, leap, and vault* imply vigorous activity. *Vault* implies that one has something on which to rest one or both hands; *bounding* is either upon or over something, as a horse, a fence, and therefore is largely an upward movement: the other movements may be chiefly horizontal.

Human Skull, from the side, with the mandible disarticulated.

a, alisphenoid, or greater wing of sphenoid; an, external auditory meatus; ba, basihyal, or body of hyoid bone; c, occipital condyle; ca, ceratohyal, or lesser cornu of hyoid; co, coronal suture; cr, coronoid process of mandible; cy, condyle of mandible; f, frontal bone; g, malar bone; h, jugal bone; i, lacrimal bone (the letter is placed in front of the nasal notch, and its line crosses the base of the nasal process of the maxilla); la, lambdoid suture; m, mastoid process of temporal; ma, mandible; mx, maxilla, or superior maxillary bone; n, nasal bone; o, occipital bone; p, parietal bone; pt, pterygoid process of sphenoid; s, squamosal section of temporal; sq, squamosal suture; st, styloid process of temporal bone (or thyrohyal); th, thyrohyal, or greater cornu of hyoid.

A skull is possessed by all vertebrates excepting the lancelets, and by no other animals. It is sometimes divided into the skull proper, cranium in strictness or brain-box, and the facial region or face. In the adult human skull eight cranial and fourteen facial bones are commonly enumerated, though the real number of osseous elements is much larger. The eight cranial bones are the occipital, two parietal, two temporal, frontal, sphenoid, and ethmoid. The fourteen facial bones are two nasals, two lacrymals, two superior maxillaries, two malars, two palatals, two inferior turbinals, one inferior maxillary, and one vomer. This enumeration of the bones is exclusive of the bonelets of the ear, which, however, are counted in vertebrates below mammals. Of these bones, the mandible, vomer, and frontal are really paired, or of lateral halves; the supramaxillary, ethmoid, sphenoid, occipital, and temporal are compound bones of several separate centers of ossification; the rest are simple. The most composite bone is the temporal, whose ankylosed styloid process (peculiar to man) is an element of the hyoid arch. A skull of similar construction characterizes mammals at large, though its figure is usually quite different (owing mainly to production of the facial and reduction of the cranial parts), and though some of the bones which are confluent in man may remain distinct. In birds the skull is characterized by the great size of the cranial bones in comparison with that of the facial bones (ex-

cepting the specially enlarged intermaxillary and infra-maxillary), the extensive and complete ankyloses of cranial bones, the permanent and perfect distinctness of pterygoid

B. Base of Human Skull, right half, outside, under surface: bo, basioccipital, or basilar process; c, occipital condyle; e, entrance to Eustachian tube, reference-line crossing foramen lacerum medium, between which and f and g is petrous part of temporal bone; h, glenoid fossa of temporal bone for articulation of lower jaw; m, mastoid process; n, posterior nares; pt, pterygoid fossa; sq, supra-occipital; st, styloid process; z, malar bone, joining zygomatic process of squamosal to form zygomatic arch or zygoma; 1, 2, anterior and posterior palatine foramina; 3, points in front of foramen lacerum medium; 4, foramen ovale; 5, carotid canal; 6, stylomastoid foramen; 7, foramen lacerum posterior, or jugular foramen.

C. Base of Human Skull, left side, interior or cerebral surface: a, alisphenoid, or greater wing of sphenoid; ba, basioccipital, or basilar process of occipital; c, cribriform plate of ethmoid; f, orbital plate of frontal; g, crista galli; h, orbitosphenoid, or lesser wing of sphenoid; i, pituitary fossa or sella turcica; p, parietal; sq, supra-occipital; sg, squamosal; 3, foramen lacerum medium; 4, foramen ovale (near it in front is foramen rotundum, behind externally is foramen spinosum); 6, foramen lacerum posterior (just beneath it is foramen lacerum anterior); 7, meatus auditorius internus, in the petrous portion of temporal, between which and orbitosphenoid is the middle fossa, before which fossa is the anterior fossa; behind the middle fossa is the posterior or cerebellar fossa. 6 is in foramen magnum.

bones, the formation of each half of the lower jaw by several recognizable pieces, and especially by the intervention of a movable quadrate bone between the squamosal and the mandible. Some other additional bones make their appearance; and the occipital condyle is always single. A skull of similar construction to that of birds characterizes reptiles proper; but here again the cranial is small in comparison with the facial region (as in the lower mammals), sometimes excessively so; the skull is more loosely constructed, with fewer ankyloses of its several elements; and some additional bones not found in any higher vertebrates first appear. The skulls of batrachians differ widely from all the above. Some additional elements appear; some usually ossified elements may be persistently cartilaginous; and branchial as well as hyoidian arches are seen to be parts of the skull. The further modifications of the skull in fishes are great and diversified; not only is there much variation in the skulls of different fishes, but also the difference between any of their skulls and those of higher vertebrates is so great that some of the bones can be only doubtfully homologized with those of higher vertebrates, while of others no homologues can be recognized. In these ichthyospondylous vertebrates, also, the skull is sometimes permanently cartilaginous, as in selachians; in the lampreys the lower jaw disappears; in the lancelets there is no skull. In fishes, also, more or fewer branchial arches are conspicuous parts of the skull, forming usually, with the compound lower jaw, by far the bulkier section of this collection of bones; and in some of them the connection of the shoulder-girdle with the skull is such that it is not always easy to say of certain bones whether they are more properly scapular or cranial. The natural evolution of the skull is, of course, from the lower to the higher vertebrates (the reverse of that above sketched). Above lampreys and hags, after a lower jaw has been acquired, the general course of evolution of the skull is to the reduction in number of its bones or cartilages by the entire disappearance of some and the confluence of others, tending on the whole to the compactness, simplicity, and symmetry of which the human skull is the extreme case, and in which, as in the skull of any mammal or bird, evidences of its actual osseous elements are chiefly to be traced in the transitory centers of ossification of the embryo. A good illustration of this is witnessed in the condition of the bones of the tongue (hyoid arch) in mammals; for even in birds (next below mammals) the tongue has a skeleton of several distinct bones, the position of which in a series of arches next after the mandibular and next before the branchial arches proper is evident. The base of the skull is generally laid down in cartilage. The dome of the skull and the facial parts are usually of membrane-bones; and to the latter some dermal or exoskeletal bones may be added. Facial parts of all skulls are of different character from cranial parts proper, in that they belong essentially to the series of visceral (hemal, not neural) arches: (1) upper jaw; (2) under jaw; (3) tongue (hyoid), followed by more or fewer successive branchial arches. The neural arches, or cranial segments proper, are at least 3 (some count 4) in number, named *occipital*, *parietal*, and *frontal*, from behind forward, represented respectively by (1) the occipital bone; (2) the basisphenoid, alisphenoid, and parietal bones; (3) the presphenoid, orbitosphenoid, and frontal bones. With these are intercalated or connected the sense-capsules of the three higher senses—namely, of hearing, sight, and smell—these being the skeletons of the ear, eye, and nose, or the petrosal parts of the temporal, the sclerotic coat of the eye, and the lateral masses of the ethmoid bone. Remaining hard parts of the head, and, as such, elements of the skull, are the teeth, borne on more or fewer bones: in mammals, when present, confined to the premaxillaries, supramaxillaries, and inframaxillaries; not present in any existing birds; in various reptiles and fishes, absent, or

borne upon the bones above named, and also, in that case, upon the sphenoid, vomer, palatals, pterygoids, hyoids, pharyngeals, etc. The body of facts or principles concerning skulls is craniology, of which craniometry is one department, especially applied to the measurement of human skulls for the purposes of ethnography or anthropology. For the human skull (otherwise than as here figured), see cuts under *craniofacial*, *craniometry*, *cranium*, *ear*, *nasal*, *orbit*, *palate*, *parietal*, and *skeleton*. skunk early attracted attention. It is mentioned in 1636 by Sagard-Théodat by several terms based on its Indian names, as *scangaresse*, *ouineque*, etc., and in the same passage, in his "History of Canada," this author calls it in French "*enfant du diable*," a name long afterward quoted as specific. It is the *fiskatta* of Kalm's "Travels," commonly translated *polecat*, a name, however, common to various other ill-scented *Mustelidae*. (See def. 2.) *Chinche*, *chinpa*, and *moufette* (specifically *moufette d'Amérique*) are book-names which have not been Englished. The New Latin synonyms are numerous. The animal inhabits all of temperate North America, and continues abundant in the most thickly settled regions. It is about as large as a house-cat, but stouter-bodied, with shorter limbs, and very long bushy tail, habitually erected or turned over the back. The color is black or blackish, conspicuously but to a variable extent set off with pure white—generally as a frontal stripe, a large crown-spot, a pair of broad divergent bands along the sides of the back, and white hairs mixed with the black ones of the tail. The fur is valuable, and when dressed is known as *Alaska sable*; the blackest pelts bring the best price. The flesh is edible, when prepared with sufficient care. The skunk is carnivorous, like other members of the same family, with which its habits in general agree; it is very prolific, bringing forth six or eight young in burrows. The fluid which furnishes the skunk's almost sole means of defense was long supposed and is still vulgarly believed to be urine. It is the peculiar secretion of a pair of perineal glands (first dissected by Jeffries Wyman in 1844), similar to those of other *Mustelidae*, but very highly developed, with strong muscular walls, capacious reservoir, and copious golden-yellow secretion, of most

slang³ (slang), *n.* [Of obscure cant origin; the
form suggests a connection with *sling*, in a way
indicated by the use of *sling* and *fling* in 'to
sling epithets,' 'to *fling* reproaches,' etc., and
by similar uses of related Scand. forms, as
Norw. *sleing*, a slinging, a device, a burden of
a song; *slenja*, sling (*slenja kjeften*, abuse,
lit. 'sling the jaw'); *slenjenamn*, a nickname;
slenje-ord, an insulting word or allusion; Icel.
slyngur, *slyngum*, cunning: see *sling*.] The noun,
in this view, must have arisen in quasi-com-
position (*slang*-patter, *slang*-word, *slang*-name,
etc.), or else from the verb. Evidence of early
use is lacking. The word has nothing to do with
language or *lingo*, and there is no evidence to es-
tablish a Gipsy origin.] 1. The cant words or
jargon used by thieves, peddlers, beggars, and
the vagabond classes generally; cant.

Slang in the sense of the cant language of thieves ap-
pears in print certainly as early as the middle of the last
century. It was included by Grose in his "Dictionary of
the Vulgar Tongue," published in 1785. But it was many
years before it was allowed a place in any vocabulary of
our speech that confined itself to the language of good
speakers and writers. Its absence from such works would
not necessarily imply that it had not been in frequent use.
Still, that this never had been the case we have direct evi-
dence. Scott, in his novel of "Redgauntlet," which ap-
peared in 1824, when using the word, felt the necessity of
defining it; and his definition shows not only that it was
generally unknown, but that it had not then begun to de-
part at all from its original sense. In the thirteenth chap-
ter of that work, one of the characters is represented as
trying to overhear a conversation, . . . but . . . "what
did actually reach his ears was disguised so completely by
the use of cant words and the thieves' Latin called *slang*
that, even when he caught the words, he found himself as
far as ever from the sense of their conversation." No one
who is now accustomed either to speak *slang* (in def. 2), or
to speak of the users of it, would think of connecting it
with anything peculiar to the language of thieves. Yet
it is clear from this one quotation that the complete
change of meaning which the term has undergone has
taken place within a good deal less than sixty years.

The Nation, Oct. 9, 1890, p. 289.

Let proper nurses be assigned, to take care of these
babes of grace (young thieves). . . . The master who teaches

all means excel.

Jonathan Wild's Advice to his Successor (1758). (*Hotten*.)

2. In present use, colloquial words and phrases
which have originated in the cant or rude speech
of the vagabond or unlettered classes, or, be-
longing in form to standard speech, have ac-
quired or have had given them restricted, capri-
cious, or extravagantly metaphorical meanings,
and are regarded as vulgar or inelegant. Ex-
amples of *slang* are *rum* for 'queer,' *gay* for 'dissolute,'
corned, *tight*, *slued*, etc., for 'intoxicated,' *awfully* for 'ex-
ceedingly,' *jolly* for 'surprising, uncommon,' *daisy* for
something or somebody that is charming or admirable,
kick the bucket or *hop the twig* for 'die,' etc. This collo-
quial *slang* also contains many words derived from thieves'
cant, such as *pal* for 'partner, companion,' *core* for 'fel-
low,' and *ticker* for 'watch.' There is a *slang* attached to

certain professions, occupations, and classes of society,
such as racing *slang*, college *slang*, club *slang*, literary
slang, political *slang*. (See *cant*.) *Slang* enters more or
less into all colloquial speech and into inferior popular
literature, as novels, newspapers, political addresses, and
is apt to break out even in more serious writings. *Slang*
as such is not necessarily vulgar or ungrammatical; in-
deed, it is generally correct in idiomatic form, and though
frequently censured on this ground, it often, in fact, owes
its doubtful character to other causes. *Slang* is often
used adjectively: as, a *slang* expression. See the quota-
tions below.

The smallest urchin whose tongue could lang
Shock'd the dame with a volley of *slang*.
Hood, Tale of a Trumpet.

Cant, as used in the phrases "thieves' cant," "tinkers'
cant," "printers' cant," or the cant of any craft or calling,
is really a language within a language, and is intended to
conceal the thoughts of those who utter it from the un-
initiated. *Slang*, on the other hand, is open to all the
world to use, and its ranks are recruited in various ways.

3. A rock the most striking characteristic of which is its fissile structure, or capability of being easily split or cleft into thin plates of nearly uniform thickness and smooth surfaces. The rocks in which a fissile structure is particularly well developed are almost exclusively the argillaceous, and those which have been more or less metamorphosed, and this fissility appears to be the result of the rearrangement of the particles of the rock into new combinations flattened into thin scales which lie in a direction at right angles to the direction in which the rock was pressed at the time the metamorphism was taking place. The best-known variety of slate is the common roofing-slate, which is compact, homogeneous, and fissile enough to be used for covering roofs, or for manufacture into tables, chimney-pieces, writing-slates, etc. The valuable varieties of roofing-slate come almost exclusively from the older metamorphic rocks. (See *cleavage* and *foliation*.) North Wales is by far the most important slate-producing region of the world, some beds having been worked there as early as the twelfth century. The principal quarries are in southern Carmarvonshire and Merionethshire in the Lower Silurian, and in Montgomeryshire in the Upper Silurian. There are also quarries in Cornwall in the Devonian, and slates of the same geological age are obtained in France in considerable quantity, as well as in parts of Germany adjacent to the Rhine. There are various quarries in Devonshire in the Carboniferous; but in most of them the slate furnished is not of first-rate quality; and, in general, it may be said that the Carboniferous is the highest geological formation producing what can properly be denominated *slate*. The slate of the United States comes almost entirely from a very low position in the geological series, as is also the case in Europe. Pennsylvania and Vermont are the principal slate-producing States, and they together furnished in 1880 nearly six sevenths in value of the total production of the country; but Pennsylvania's share was three times as great as that of Vermont.

2. The keeping or holding of slaves; the practice of keeping human beings in a state of servitude or bondage. Slavery seems to have existed everywhere from very early times. It is recognized in the Old Testament as a prevailing custom, and the Levitical laws contain many regulations in regard to slaves and their rights and duties. Slavery died out gradually in England in the latter part of the middle ages, and slavery was abolished throughout the British empire in 1833, after long agitation, the sum of twenty million pounds sterling being paid as compensation to the slave-owners. Negro slavery was introduced into the present territory of the United States in 1620, and became recognized as an institution. The Northern States gradually got rid of their slaves by emancipation or transportation in the latter part of the eighteenth and the early part of the nineteenth century. Slavery became a leading and agitating question from the time of the Missouri Compromise (1820), and the number of slave States increased to fifteen. (See *slave State*, under *slave*², a.) President Lincoln, by his Emancipation Proclamation of January 1st, 1863, declared free all slaves in that part of the Union designated as in rebellion; and the thirteenth amendment to the Constitution, 1865, abolished slavery within the United States. Slavery has been abolished by various other countries in the nineteenth century, as by Brazil in 1888.

MHG. *slāf*, G. *schlaf* = Goth. *slēps*, sleep; from the verb.] 1. A state of general marked quiescence of voluntary and conscious (as well as many involuntary and unconscious) functions, alternating more or less regularly with periods of activity. In human sleep, when it is deep, the body lies quiet, with the muscles relaxed, the pulse rate lower than during the waking hours, and the respiration less frequent but deep, while the person does not react to slight sensory stimuli. Intestinal peristalsis is diminished; secretion is less actively carried on; the pupils are contracted; and the brain is said to be anemic. If the depth of sleep is measured by the noise necessary to waken the sleeper, it reaches its maximum within the first hour and then diminishes, at first rapidly, then more slowly.

Half in a dreme, not fully weel a-wakid,
The golden *sleep* me wrapt vndir his wieng.

Political Poems, etc. (ed. Furnivall), p. 52.

Else could they not catch tender *sleep*; which still
Is shy and fearful, and flies every voice.

J. Beaumont, *Psyche*, iv. 41.

Sleep is a normal condition of the body, occurring periodically, in which there is a greater or less degree of unconsciousness due to inactivity of the nervous system and more especially of the brain and spinal cord. It may be regarded as the condition of rest of the nervous system during which there is a renewal of the energy that has been expended in the hours of wakefulness.

No noise, but silence and eternal *sleep*.

4. Specifically, in *zool.*, the protracted and profound dormancy or torpidity into which various animals fall periodically at certain seasons of the year. Two kinds of this sleep are distinguished as *summer* and *winter sleep*, technically known as *estivation* and *hibernation* (see these words).

5. In bot., nyctitropism, or the sleep-movement of plants, a condition brought about in the foliar or floral organs of certain plants, in which they assume at nightfall, or just before, positions unlike those which they have maintained during the day. These movements in the case of leaves are usually drooping movements, and are therefore suggestive of rest, but the direction of movement is different

in different cases. Thus, among the *Oxalidaceae* the sleep-movement consists in the downward sinking of the leaflets, which become at the same time folded on themselves. Among the *Leguminosae*, the leaflets, in some cases, simply sink vertically downward (*Phaseolus*); in others, they sink down while the main petiole rises (terminal leaflet of *Desmodium*); in others, they sink downward and twist on their axes so that their upper surfaces are in contact beneath the main petiole (*Cassia*); in others, again, they rise and bend backward toward the insertion of the petiole (*Coronilla*); in others, they rise, and the main petiole rises also, whereas in *Mimosa pudica* the leaflets rise and bend forward, while the main petiole falls. In *Marsilea* the leaflets rise up, the two upper ones being embraced by the two lower. (*S. H. Vines*.) The mechanism of these movements is explained by Pfeffer and others as due to an increased growth on one side of the median line of the petiole or midrib, followed, after a certain interval of time, by a corresponding growth on the opposite side. It is also accomplished by simple turgescence of opposite sides. The utility of the sleep-movements is believed to consist in protection from too great radiation. The cause or causes of these movements (and of analogous movements which have been called *diurnal sleep*: see the second quotation) are only imperfectly known, but they are undoubtedly largely due to sensitiveness to variations in the intensity of light. See *nyctitropism*.

Those movements which are brought about by changes in the amount of light constitute what are known as the "sleep" and "waking" of plants. *Bessey*, Botany, p. 198.

There is another class of movements, dependent on the action of light. . . . We refer to the movements of leaves and cotyledons which when moderately illuminated are diheliotropic, but which change their positions and present their edges to the light when the sun shines brightly on them. These movements have sometimes been called *diurnal sleep*. *Darwin*, Movement in Plants, p. 445.

(b) In *milit. engin.*, one of the small joists of wood which form the foundation for a battery platform. (c) A piece of wood, metal, or other material upon which the rails or the rail-chairs of a railway rest, and to which they are fastened. Wood of durable varieties is far more extensively used for this purpose than any other material, but stone, toughened glass, and iron have also been used, the last to a considerable extent. In some instances the sleepers are laid longitudinally with the rails, and bound together by cross-ties. This system is in use on some important European railways, and generally on elevated railways and street railways, both in the United States and elsewhere; but the most common method is to lay the sleepers at right angles to the rails, and about 2 feet from center to center, except when they support points and angle-bars, when they are placed 1 foot 6 inches from center to center. They are thus made to act both as sleepers and as cross-ties. Such sleepers are in the United States also called *railway-ties* or simply *ties*. See cut under *rail-chair*.

Well-developed slickensides are most frequently seen in connection with mineral veins, but the sides of joints in non-metallic rocks occasionally exhibit this kind of striation. Slickensided surfaces are frequently coated with a thin film of pyrites, galena, hematite, or some other mineral, which may be polished so as to reflect the light like a mirror (whence the French name *miroirs*).

Nearly akin to this jointed character are the *slicken-sides*, or polished and striated surfaces, which, sometimes of iron pyrites, but more usually of copper pyrites, often cover the faces of the walls of lodes.

As facilitating alterations of pitch in pure intonation, it has decided advantages over both keys and valves. Also called *long valve*.

By drawing the knob the slider of a set of pipes is pushed into such position that they may be sounded by the digitals. Also *slide*. See *organ*, 1, *stop*, and *wind-chest*. (g) In racing boats, a sliding seat.

2. The potter, skilpot, red-fender, or red-bellied terrapin, *Pseudemys rugosa* (or *Chrysemys rubriventris*), an inferior kind of terrapin or turtle sometimes cooked in place of the genuine *Malacoclemmys palustris*, or diamond-back. Slide-valve.

δ, valve inclosed in steam-chest *c'*, and moved by the valve-rod or stem *a*. The valve-rod derives a reciprocating motion from the rock-lever *g*, pivoted at *c* and connected at the lower end with the eccentric-rod *h*, the latter being reciprocated by the eccentric *g*. *a'*, *a''*, induction-ports which also alternately act as exhaust-ports; *e*, exhaust-port; *d*, pitman or connecting-rod which, being connected to the piston-rod *k*, reciprocated by the piston *p*, imparts circular motion to the crank *f*, crank-shaft *j*, and eccentric *g*.

adapted to work or slide, upon a flat-faced seat which includes a port or ports to be alternately opened and closed by the reciprocation of the slide. It is in extensive use in the cheaper forms of steam-engines, compressed-air engines, hydraulic motors, gas- and water-meters, in some kinds of air-compressors, and in some compressed-air ice-machines. In England the slide-valve is very commonly called simply a *slide*.—**Circular slide-valve**, a form of faucet-valve; a cylindrical valve with ports in depressed sections of its periphery, serving to bring the ends of the cylinder alternately in connection with the steam-chest and the exhaust-port.—**Slide-valve motion**. The sport of gliding on snow or ice, on the feet, on a sled or a toboggan, or (in former use) on skates, etc.

Sliding upon the ice appears to have been a very favourite pastime among the youth of this country in former times; at present the use of skates is so generally diffused throughout the kingdom that *sliding* is but little practised.

4. A South American tardigrade edentate mammal of the family *Bradypodidae*: so called from their slow and apparently awkward or clumsy movements. The slowness of their motions on the ground is the necessary consequence of their disproportioned structure, and particularly of the fact that the feet exhibit a conformation resembling that of clubfoot in man—a disposition of the carpal and tarsal joints highly useful in climbing. Sloths live on trees, and never remove from one until they have stripped it of every leaf. They are helpless when on the ground, and seem at home only on trees, suspended beneath the branches, along which they are sometimes observed to travel from tree to tree with considerable celerity. The female produces a single young one at a birth, which she carries about with her until it is able to climb. Sloths are confined to the wooded regions of tropical America, extending northward into Mexico. At least 12 species are described, but the true number is fewer. All have three toes on the hind feet, but some have only two on the fore feet, whence the obvious distinction of *three-toed* and *two-toed* sloths (a distinction even more strongly marked in the anatomy of these animals) warranted a division of the family into *bradypods* (*Bradypodinae*) and *chelopodines* (*Chelopodinae*). Most sloths belong to the former group, and these have the general name *ai*. The best-known of these is the collared three-toed sloth, *Bradypus tridactylus* or *torquatus*, with a sort of mane. The unau or two-toed sloth, *Cholopus didactylus*, inhabits Brazil; it is entirely covered with long coarse woolly hair. (See cut under *Cholopus*.) A second and quite distinct species of this genus, *C. hoffmanni*, inhabits Central America. (See *Tardigrada*, 1.) The name is apparently a translation of the Portuguese word *preguiça* (Latin *pigritia*), slowness, slothfulness. See the quotation.

Here [in Brazil] is a Beast so slow in motion that in fifteen days he cannot go further than a man can throw a stone; whence the Portugals call it *Pigritia*.

smell (smel), *n.* [< ME. *smel*, *smil*, *smul*, *sméal*, *smool* (not found in AS.): see the verb.] 1.

The faculty of perceiving by the nose; sense-perception through the olfactory nerves; the olfactory faculty or function; the physiological process or function whereby certain odoriferous qualities of bodies, as scent or effluvium, are perceived and recognized through sensation; olfaction; scent: often with the definite article, as one of the special senses: as, the *smell* in dogs is keen. The essential organ of smell is located in a special part or lobe of the brain, the rhinencephalon, or olfactory lobe, whence are given off more or fewer olfactory nerves, which pass out of the cranial cavity into the nasal organ, or nose, in the mucous or Schneiderian membrane of the interior of which they ramify, so that air laden with odoriferous particles can affect the nerves when it is drawn into or through the nasal passages. In man the sense of smell is very feeble and imperfect in comparison with that of many animals, especially of the carnivores, which pursue their prey by scent, and ruminants, which escape their enemies by the same means. Smell in the lower animals seems to be the guiding sense in determining their choice of food.

Memory, imagination, old sentiments and associations, are more readily reached through the sense of *smell* than by almost any other channel. *O. W. Holmes*, *Autocrat*, IV.

Smell is a sensation excited by the contact with the olfactory region of certain substances, usually in a gaseous condition and necessarily in a state of the subdivision. *Encyc. Brit.*, XXII. 165.

It will be observed that sound is more promptly reacted on than either sight or touch. Taste and *smell* are slower than either. *W. James*, *Prin. of Psychology*, I. 96.

2. That quality of anything which is or may be smelled; an odoriferous effluvium; an odor or scent, whether agreeable or offensive; a fragrance, perfume, or stench; aroma: as, the *smell* of thyme; the *smell* of bilge-water.

Suettene *smul* ne myzte be then the smoke *smulde*.

Mrs. Browning, *Aurora Leigh*, IV.

3. A faint impression; a subtle suggestion; a hint; a trace: as, the poem has a *smell* of the woods.—4. An act of smelling: as, he took a *smell* at the bottle.—*syn.* *Smell*, *Scent*, *Odor*, *Savor*, *Perfume*, *Fragrance*, *Aroma*, *Stench*, *Stink*. *Smell* and *scent* express the physical sense, the exercise of the sense, and the thing which appeals to the sense. The others have only the last of these three meanings. Of the nine words the first four may express that which is pleasant or unpleasant, the next three only that which is pleasant, the last two only that which is very unpleasant. *Smell* is the general word; the others are species under it. *Scent* is the smell that proceeds naturally from something that has life: as, the *scent* of game; the *scent* of the tea-rose. *Odor* is little more than a Latin substitute for *smell*: as, the *odor* of musk, of decaying vegetation; it may be a dainty word, as *smell* cannot be. *Savor* is a distinctive smell, suggesting taste or flavor, proceeding especially from some article of food: as, the *savor* of garlic. *Perfume* is generally a strong or rich but agreeable smell. *Fragrance* is best used to express fresh, delicate, and delicious odors, especially such as emanate from living things: as, the *fragrance* of the violet, of new-mown hay, of the breath of an infant. *Aroma* should be restricted to a somewhat spicy smell: as, the *aroma* of roasted coffee, or of the musk-rose. *Stench* and *stink* are historically the same word, in different de-

grees of strength, representing a strong, penetrating, and disgusting odor; *stink* is not for polite use.

Connection with *melt* is doubtful.] 1. *trans.* To fuse; melt; specifically, to treat (ore) in the large way, and chiefly in a furnace or by the aid of heat, for the purpose of separating the contained metal. Metallurgical operations carried on in the moist way, as the amalgamation of gold and silver ores in pans, treatment by lixiviation, etc., are not generally designated by the term *smelting*. Establishments where this is done are more commonly called mills or reduction-works, and those in which the ores are smelted are usually designated as blast-furnaces or iron-furnaces. The vari-

ous smelting operations differ greatly from each other, according to the nature of the combinations operated on. Simple ores, like galena, require only a very simple series of operations, which are essentially continuous in one and the same furnace; more complicated combinations, like the mixtures of various cupriferous ores smelted at Swansea by the English method, require several successive operations, entirely disconnected from each other, and performed in different furnaces. In the most general way, the essential order of succession of the various processes by which the sulphureted ores (and most ores are sulphureted) are treated is as follows: (1) calcination or roasting, to oxidize and get rid (as far as possible) of the sulphur; (2) reduction of the metal contained in the oxidized combinations obtained; (3) refining, or getting rid of the last traces of deleterious metals associated in the ores with the useful metal, to obtain which is the essential object of the operation.

II. intrans. To fuse; melt; dissolve.

It inhabits the Pacific coast of the United States from California northward, reaches a length of about 12 inches, and is highly esteemed as a food-fish. (c) In California, any species of the family *Atherinidae*, resembling the true smelt in general appearance, but provided with an anterior spinous and a posterior branched dorsal fin, and having the ventrals not far behind the pectorals. The common Californian smelt, *Atherinopsis californiensis*, reaches a length of about 18 inches, and its flesh is fine, firm, and of excellent flavor, though a little dry. (d) A freshwater cyprinoid, *Hybognathus regius*, which somewhat resembles the true smelt in form, translucency, and color; also, one of other cyprinoids, as the spawn-eater and the silversides. smight, *v.* An obsolete erroneous spelling of *smite*.

Smilacæ (smī-lā'sē-ē), *n. pl.* [NL. (R. Brown, 1810), for **Smilacææ*, < *Smilax* (*Smilac-*) + -acææ.] A group of monocotyledonous plants, by many regarded as a distinct order, but now classed as a tribe of the order *Liliacæ*. It is characterized by a sarmenose or climbing stem, three-to five-nerved leaves, anthers apparently of a single cell, the inner cell being very narrow, and ovules solitary or twin. It includes the typical genus *Smilax*, and 2 small genera of about 5 species each, *Heterosmilax* of eastern Asia, and *Rhipogonum* of Australia and New Zealand.

Smilacina (smī-lā-sī'nā), *n.* [NL. (Desfontaines, 1807), < *Smilax* (-ac-) + -ina.] A genus of liliaceous plants, of the tribe *Polygonatæ*. It is characterized by flowers in a terminal panicle or raceme with a spreading six-parted perianth, six stamens, and a three-celled ovary which becomes in fruit a globose pulpy berry, often with but a single seed. There are about 20 species, all natives of the northern hemisphere; 3 occur in the eastern and 3 in the Pacific United States—only one, *S. stellata*, being common to both; 7 species are natives of Mexico and Central America, and others are found in Asia. They are somewhat delicate plants, producing an erect unbranched leafy stem from a creeping rootstock, and bearing alternate short-petioled leaves and small usually white or cream-colored flowers. They are known by the name of *false Solomon's seal*, especially *S. racemosa*, the larger Eastern species, the rhizome of which is said to be diuretic, diaphoretic, and a mild alterative.

Smilax (smī'laks), *n.* [NL. (Tournefort, 1700), < L. *smilax*, < Gr. *σμίλαξ*, the yew (also *μίσλαξ*), also a kind of evergreen oak; *σμίλαξ κρηνα*, 'garden smilax,' a leguminous plant, the fruit of which was dressed and eaten like kidney-beans; *σμίλαξ λεία*, 'smooth smilax,' a kind of bindweed or convolvulus.] 1. A genus of liliaceous

plants, type of the tribe *Smilacæ*. It is characterized by dioecious flowers in umbels, with a perianth of six distinct curving segments, the fertile containing several, sometimes six, thread-shaped stamens, three broad recurved stigmas, and a three-celled ovary which becomes in fruit a globose berry usually containing but one or two seeds. There are about 200 species, widely scattered through most tropical and temperate regions; 11 occur in the northeastern United States. They are usually woody vines from a stout rootstock, bearing alternate two-ranked evergreen leaves with retic-

ulated veins between the three or more prominent nerves. The petioles are persistent at the base, and are often furnished with two tendrils, by which some species climb to great heights, and others mat into densely tangled thickets. Various tropical American species yield sarsaparilla. (See *Sarsaparilla* and *china-root*.) *S. aspera* of the south of Europe, called *rough bindweed* or *prickly toy*, is the source of Italian sarsaparilla. Other species are used medicinally in India, Australia, Mauritius, and the Philippines. One of these, *S. glycyphyllos*, an evergreen shrubby climber of Australia, is there known as *sweet tea*, from the use of its leaves. The rootstocks of many species are large and tuberiferous; those of *S. Pseudo-China* are used in the southern United States to fatten hogs, and as the source of a domestic beer; those of *S. China* yield a dye. The stems of some pilant species, as *S. Pseudo-China*, are used in basket-making, and the young shoots of a Persian species are there used as asparagus. *S. Pseudo-China* and *S. bona-nox* are known as *bullbrier*, and several others with prickly stems as *cat-brier* and *greenbrier*. See also *carrion-flower*.

2. [l. c.] (a) A plant of the genus *Smilax*. (b) A delicate greenhouse vine from the Cape of Good Hope, best known as *Myrsiphyllum asparagoides*, now classed under *Asparagus*. Its apparent leaves (really expanded branches) are bright-green on both sides, with the aspect of those of *Smilax*, but finer. The plant grows to a length of several feet, festooning beautifully. It is much used in decoration, and forms the leading green constituent in bouquets. It is sometimes called *Boston smilax*.

Smoking meat consists in exposing meat previously salted, or rubbed over with salt, to wood-smoke in an apartment so distant from the fire as not to be unduly heated by it, the smoke being admitted by flues at the bottom of the side walls. Here the meat absorbs the empyreumatic acid of the smoke, and is dried at the same time. The kind of wood used affects the quality and taste of the meat, smoke from beech and oak being preferable to that from fir and larch. Smoke from the twigs and berries of juniper, or from rosemary, peppermint, etc., imparts somewhat of the aromatic flavor of these plants. A slow smoking with a slender fire is better than a quick and hot one, as it allows the empyreumatic principles time to penetrate into the interior without over-drying the outside.

The stinking smut is caused by two species of fungus, which differ only in microscopic characters—*Tilletia tritici*, with rough spores, and *T. foetens*, with smooth spores. It is the most destructive disease of wheat known, not infrequently causing the loss of half of the crop or more. It occurs to some extent throughout all the wheat-growing regions, but is especially common in Indiana, Iowa, and adjacent States, as well as in California and Europe. The disease does not spread from plant to plant or from field to field, but the infection takes place at the time the seed sprouts. No remedy can be applied after the grain is sown, but the disease can be prevented by sowing clean seed in clean soil and covering well. Smutty seed can be purified by wetting thoroughly with a solution of blue vitriol, using one pound or more to a gallon of water. Black smut may be similarly treated. *U. Maydis* is the smut of Indian corn; *U. destruens*, of *Setaria glauca*; *U. urædum*, of many species of *Carex*, etc. See *Ustilago*, *Tilletia*, *maize smut*, *bunt*, *bunt-eat*, *burnt-eat*, *brand*, &c.

A bird of the genus *Scolopax* in a former broad sense. (a) Some or any bird belonging to the family *Scolopacidae*, having the bill straight, much longer than the head, dilated and sensitive at the end, and with a median lengthwise groove on the upper mandible near the end, the toes cleft to the base, the primaries not emarginate, and the tail-feathers barred; especially, a member of the genus *Gallinago* (*Scolopax* being restricted to certain woodcock). In Great Britain three species of *Gallinago* are called *snipe*. (1) The common snipe, or whole snipe, is *Gallinago caelestis* or *G. media*, formerly *Scolopax gallinago*. (2) The great, double, or solitary snipe, or woodcock-snipe, is *G. major*. (3) The small snipe, half-snipe, or jack-snipe is *G. gallinula*. They differ little except in size. In the United States the common snipe, also called *jack-snipe* and *Wilson's snipe*, is *G. wilsoni* or *G. delicata*, about as large as *G. media*, which it very closely resembles, so that it is sometimes known as the "English" snipe, to distinguish it from various snipe-like birds peculiar to America, and also *hog-snipe*, *quitter-snipe*, *meadow-snipe*, *alewife-bird*, *shad-bird*, and *shad-spirit*. It is from 10½ to 11½ inches long and from 17½ to 19½ in extent of wings; the bill is about 2½ inches long. The upper parts are blackish, varied with bay and tawny; the scapulars are edged with tawny or pale buff, forming a pair of firm stripes along the sides of the back when the wings are closed; the lining of the wings and axillary feathers is barred regularly with black and white; the tail-feathers, normally sixteen in number, are barred with black, white, and chestnut; the fore neck and breast are light-brown speckled with dark-brown; and the belly is white. (See cut under *Gallinago*.) Snipes like these, and of the same genus, are found in most countries, and are called by the same name, with or without a qualifying term. (b) Some other scolopacine or snipe-like bird. There are very many such birds, chiefly distinguished from sandpipers (see *sandpiper*) by the length, from tattlers or gambets by the sensitiveness, and from curlews, godwits, etc., by the straightness of the bill. (1) In the United States the gray-backed or red-breasted snipes are birds of the genus *Macrorhamphus*, of which there are 2 species or varieties, the lesser and greater longbeak, *M. griseus* and *M. scolopaceus*. See *doctichee*. (2) The grass-snipe is the pectoral sandpiper, *Actodromas maculata*. See cut under *sandpiper*. Also called *jack-snipe*. (3) The robin-snipe is the knot, *Tringa canutus*, also a sandpiper. (4) The stone-snipe is *Totanus melanoleucus*, a tattler. See cut under *yellowlegs*. (5) In Great Britain the sea-snipe is the dunlin, *Tringa or Pelidna alpina*, a sandpiper. (6) In Great Britain the summer snipe is the common sandpiper, *Actitis hypoleucos*. (7) Painted snipe are the curious birds of the genus *Rhyncosia* or *Rostratula*. See these words. (c) A common misnomer, in various localities, of the American woodcock, *Philohela minor*: also called *common snipe*, *big snipe*, *mud-snipe*, *red-breasted snipe*, *big-headed snipe*, *blind snipe*, *whistling snipe*, *wood snipe*. See *woodcock*. (d) A misnomer of the long-billed curlew. R. Ridgway. [Salt Lake valley.] (e) *pl. The Scolopacidae*; the snipe family. [The plural means either two or more birds of one kind, or two or more kinds of these birds: in the former sense, the plural is generally *snipe*; in the latter, *snipes*.]

The aqueous vapor of the atmosphere precipitated in a crystalline form, and falling to the earth in flakes, each flake consisting of a distinct crystal, or more commonly of combinations of separate crystals. they present uncounted varieties of very beautiful figures. The whiteness of snow is due primarily to the large number of reflecting surfaces arising from the minuteness of the crystals. When sufficient pressure is applied, the slightly adhering crystals are brought into

molecular contact, and the snow, losing its white color, assumes the form of ice. This change takes place when snow is gradually transformed into the ice of a glacier. Precipitation takes the form of snow when the temperature of the air at the earth's surface is near or below the freezing-point, and the flakes are larger the moister the air and the higher its temperature. The annual depth of snowfall and the number of days on which the ground is covered with snow are important elements of climate. In a ship's log-book abbreviated a.

snow-line (snō'lin), *n.* The limit of continual snow, or the line above which a mountain is continually covered with snow. The snow-line is due primarily to the decrease of the temperature of the atmosphere with increase of altitude. In general, the height of the snow-line diminishes as we proceed from the equator toward the poles; but there are many exceptions, since the position of the snow-line depends not only upon the mean temperature, but upon the extreme heat of summer, the total annual snowfall, the prevalent winds, the topography, etc. For these reasons, the snow-line is not only at different heights in the same latitude, but its position is subject to oscillation from year to year in the same locality. Long secular oscillations in the height of the snow-line are evidence of corresponding oscillations of climate. In the Alps the snow-line is at an altitude of 8,000 to 9,000 feet; in the Andes, at the equator, it is nearly 16,000 feet.

Between the glacier below the ice-fall and the plateau above it there must exist a line where the quantity of snow which falls is exactly equal to the quantity annually melted. This is the snow-line.

character of the country, the amount of snowfall, the tendency to drift, etc. Such plows vary in size from the simple plows carried on the front of an engine, resembling a cowcatcher with smooth iron sides, to heavy structures mounted on freight-car trucks, and pushed before one locomotive or more, or, as sometimes made, self-propelling. In recent forms the principle of centrifugal force has been utilized for removal of the snow. Snow-plows are often of great size, sometimes weighing fifty tons, and can be forced through very deep drifts.

It has a light rim of tough wood, on which is woven from side to side a web of rawhide. The Norwegian is merely a thin board, about 8 feet long and 3 inches wide, slightly curved upward in front; it is especially adapted to mountains, in descending which by its use great speed is attained. See *skoe*.

snow-snake (snō'snāk), *n.* Among North American Indians, a slender shaft from 5 to 9 feet long, with a head curving up at one end and a notch at the other and smaller end; also, the game played with this shaft.

The game is simply one of dexterity and strength. The forefinger is placed in the basal notch, the thumb and remaining fingers reaching along the shaft, and the snow-snake is thrown forward on the ice or hard snow.

When the slender shaft is thrown, it glides rapidly over the surface, with upraised head and a quivering motion, that gives it a strange resemblance to a living creature. . . . A chemical compound in common domestic use for washing and cleansing, made by the union of certain fatty acids with a salifiable base. Fats and fixed oils consist of fatty acids combined with glycerin. On treating them with a strong base, like potash or soda, glycerin is set free, and the fatty acid combines with the strong base and forms a soap. Soap is of two kinds—*soluble* soap, in which the base is potash, soda, or ammonia, and *insoluble* soap, whose base is an earth or a metallic oxid. Only the soluble soaps dissolve readily in water and have detergent qualities. Insoluble soaps are used only in pharmacy for liniments or plasters. Of the fats, stearates make the hardest, oleates the softest soaps; and of the bases, soda makes the hardest and least soluble, and potash the softest and most soluble. Perfumes are occasionally added, or various coloring matters are stirred in while the soap is semi-fluid. White soaps are generally made of olive-oil and soda. Common household soaps are made chiefly of soda and tallow. Yellow soap is composed of tallow, rosin, and soda, to which some palm-oil is occasionally added. (See *rosin-soap*.) Mottled soap is made by simply adding mineral and other colors during the manufacture of ordinary hard soap. Marine soap, known as *salt-water soap*, which has the property of dissolving as well in salt water as in fresh, is made of palm- or cocoanut-oil and soda. Soft soaps are made with potash, instead of soda, and whale-, seal-, or olive-oil, or the oils of linseed, hemp-seed, rape-seed, etc., with the addition of a little tallow. Excellent soaps are made from palm-oil and soda. A solution of soap in alcohol, with camphor and a little essential oil added to scent it, forms a soft ointment called *opodeldoc*, now superseded by soap-liniment, a similar preparation, which is liquid. Medicinal soap, when pure, is prepared from caustic soda and either olive- or almond-oil. It is chiefly employed to form pills of a gently aperient antacid action. 2†. A kind of pomade for coloring the hair. [Only as a translation of the Latin.]—3. Smooth words; persuasion; flattery: more often called *soft soap*. [Slang.]

1. To mount on wings, or as on wings, through the air; fly aloft, as a bird or other winged creature; specifically, to rise and remain on the wing without visible movements of the pinions. The specific mode of flight is specially distinguished from any one in which the wings are flapped to beat the air; but the term *soaring* is also loosely applied to any light, easy flight to a great height with little advance in any other direction, whatever be the action of the wings, as of a skylark rising nearly vertically from the ground. In the case of heavy-bodied, short-winged birds which fly up thus, the action is often specified as *rocketing* or *towering* (see these verbs). A kind of swift wayward soaring, as of

the swallow, is often called *skimming*. Soaring specifically so called, or sailing on the air, is best shown in the flight of long-winged birds, whether their wings be either narrow and sharp, or ample and blunt, as the albatross, frigate, and some other sea-birds, storks, cranes, and some other large waders, turkey-buzzards and other vultures, eagles, kites, and some other large birds of prey. It is capable of being indefinitely protracted, either on a horizontal plane, or at a considerable inclination upward, at least in some cases; but most birds which soar to a higher level without beating the wings take a spiral course, mounting as much as they can on that part of each lap which is against the wind, and this action is usually specified as *gyrating* or *circling*.

So have I seen a lark rising from his bed of grass, and soaring upwards, singing as he rises, and hopes to get to heaven, and climb above the clouds.

Jer. Taylor, Sermon, The Return of Prayers, II.

2. To mount or rise aloft; rise, or seem to rise, lightly in the air.

In one bright blaze, and then descend no more. *Dryden*.

For the present its members content themselves with the promotion of measures for the amelioration of the condition of the working classes, such as shortening the hours of labor, forbidding the employment of children in factories, and higher education for all. Social Democrats are now found in many of the countries of Europe, as well as in the United States. Since the fusion of the Lassalle and Marx groups of socialists in 1875, the social-democratic party in Germany has had remarkable development.—**Social dynamics**, that branch of sociology which treats of the conditions of the progress of society from one epoch to another. It concerns itself more especially with questions relating to public health, education, labor, punishment of crime, reformation of criminals, pauperism, and the like. It thus deals with the

effect of existing social forces and their result on the general well-being of the community, without directly discussing or expounding the theories or examining the problems of sociology, of which it may be considered as a branch.—**Social statics**, that branch of sociology which treats of the conditions of the stability or equilibrium of the different parts of society or the theory of the mutual action and reaction of contemporaneous social phenomena on each other, giving rise to what is called *social order*.—**Social war**, in *Rom. hist.*, the war (90–88 B. Also called the *Marsic war*, from the Marsi, who took a leading part in the movement.—**Social wasps**, the *Vespidae*, including hornets or yellow jackets, which build large papery nests inhabited by many individuals. socialism (sō'shāl-izm), *n.* [= *F. socialisme* = *Sp. Pg. socialismo* = *G. socialismus*; as *social + -ism*.] Any theory or system of social organization which would abolish, entirely or in great part, the individual effort and competition on which modern society rests, and substitute for it coöperative action, would introduce a more perfect and equal distribution of the products of labor, and would make land and capital, as the instruments and means of production, the joint possession of the members of the community. The name is used to include a great variety of social theories and reforms which have more or less of this character.

What is characteristic of *socialism* is the joint ownership by all the members of the community of the instruments and means of production; which carries with it the consequence that the division of the produce among the body of owners must be a public act performed according to rules laid down by the community. *Socialism* by no means excludes private ownership of articles of consumption.

J. S. Mill, *Socialism*.

Socialism, . . . while it may admit the state's right of property over against another state, does away with all ownership, on the part of members of the state, of things that do not perish in the using, or of their own labor in creating material products.

Woodsey, *Communism and Socialism*, p. 7.

Christian socialism, a doctrine of somewhat socialistic tendency which sprang up in England about 1830, and flourished under the leadership of Charles Kingsley, Frederick D. Maurice, Thomas Hughes, and others. The main contentions of its advocates were (1) that Christianity should be directly applied to the ordinary business of life, and that in view of this the present system of competition should give place to coöperative associations both productive and distributive, where all might work together as brothers; (2) that any other change of the laborer's life, as aimed at in most socialistic schemes, would not suffice to settle the labor question, but that there must be an inner change brought about by education and elevation of character, especially through Christianity; and (3) that the aid of the state should not be invoked further than to remove all hostile legislation. A similar scheme appeared somewhat earlier in France. The doctrines of Christian socialism, or similar doctrines under the same name, have been frequently advocated in the United States.—**Professorial socialism**. Same as *socialism of the chair*.—**Socialism of the chair**, a name (first used in ridicule in 1872 by Oppenheim, one of the leaders of the National Liberals) for the doctrines of a school of political economy in Germany which repudiated the principle of laissez-faire, adopted in the study of political economy the historical method (which see, under *historical*), and strove to secure the aid of the state in bringing about a better distribution of the products of labor and capital, especially to bring to the laborer a larger share of this product, and to elevate his condition by means of factory acts, savings-banks, sanitary measures, shortening of the hours of labor, etc.

The term is in theological usage a general one, and includes a considerable variety of opinion. The Socinians believe that Christ was a man, miraculously conceived and divinely endowed, and thus entitled to honor and reverence, but not to divine worship; that the object of his death was to perfect and complete his example and to prepare the way for his resurrection, the necessary historical basis of Christianity; that baptism is a declarative rite merely, and the Lord's Supper merely commemorative; that divine grace is general and exerted through the means of grace, not special and personally efficacious; that the Holy Spirit is not a distinct person, but the divine energy; that the authority of Scripture is subordinate to that of the reason; that the soul is pure by nature, though contaminated by evil example and teaching from a very early age; and that salvation consists in accepting Christ's teaching and following his example. The Socinians thus occupy theologically a midway position between the Arians, who maintain the divinity of Jesus Christ, but deny that he is co-equal with the Father, and the Humanitarians, who deny his supernatural character altogether.

Socratic (sō-krat'ik), *a.* and *n.* [= F. *Socratique* = Sp. *Socrático* = Pg. It. *Socratico*, < L. *Socraticus*, < Gr. *Σωκρατικός*, of or pertaining to Socrates, < *Σωκράτης*, Socrates.] 1. *a.* Of or pertaining to the methods, style, doctrine, character, person, or followers of the illustrious Athenian philosopher Socrates (about 470–399 B. C.).

His father, Sophroniscus, was a sculptor, and he was brought up to the same profession. His mother, Phænarete, was a midwife. Socrates was unjustly accused before the council of the prytanes of being a corrupter of youth and of not believing in the gods of the city, was condemned, and died by drinking hemlock. His philosophy is known to us by the account of Xenophon, written to show the practical upshot of his teachings and the injustice of his sentence, and by the Dialogues of Plato, in most of which Socrates is introduced only to give an artistic setting to Plato's own discussions. Some things can also be inferred from fragments of *Æschines*, and from the doctrines of other companions of Socrates. He wrote nothing, but went about Athens frequenting some of the best houses, and followed by a train of wealthy young men, frequently cross-questioning those teachers whose influence he distrusted. He himself did not profess to be capable of teaching anything, except consciousness of ignorance; and he bargained for no pay, though he no doubt took moderate presents. He called his method of discussion (the *Socratic method*) *obolistics* (see *maieutic*), because it was an art of inducing his interlocutors to develop their own ideas under a catechetical system. He put the pretensions to shame by the practice of *Socratic irony*, which consisted in sincerely acknowledging his own defective knowledge and professing his earnest desire to learn, while courteously admitting the pretensions of the person interrogated, and in persisting in this attitude until examination made it appear bitter sarcasm. He was opposed to the rhetorical teaching of the sophists, and had neither interest nor confidence in the physical speculations of his time. The center of his philosophy, as of all those which sprang directly or indirectly from him—that is to say, of all European philosophy down to the rise of modern science—was morality. He held that virtue was a species of knowledge; really to know the right and not to do it was impossible, hence wrong-doers ought not to be punished: virtue was knowledge of the truly useful. He was far, however, from regarding pleasure as the ultimate good, declaring that if anything was good in itself, he neither knew it nor wished to know it. The great problems he held to consist in forming general conceptions of the nature of truth, happiness, virtue and the virtues, friendships, the soul, a ruler, a suit of armor—in short, of all objects of interest. These conceptions were embodied in definitions, and these definitions were framed by means of analytic reflection upon special instances concerning which all the world were agreed. He would not allow that anything was known for certain concerning which competent minds differed differently. This process of generalization, the *Socratic induction*, together with the doctrine of the necessity of definitions, were his two contributions to logic. The disciples of Socrates were Plato, Euclides, Phædo, Antisthenes, Aristippus, Xenophon, *Æschines*, *Simonias*, *Cebes*, and about twenty more. Properly speaking, there was no Socratic school; but the Academy and the Megarian, Elean, Eretrian, Cynic, and Cyrenaic schools are called *Socratic*, as having been founded by immediate disciples of Socrates.—**Socratic school**. See *school*.

soda (sō'dā), *n.* [= F. Sp. Pg. D. G. Sw. Dan. *soda* (NL. *soda*), < It. *soda*, *soda*, Olt. *soda* (= OF. *soulde*), saltwort, glasswort, fem. of *sodo*, contr. of *solido*, solid, hard: see *solid*.] 1. Sesquicarbonate or normal carbonate of sodium (Na_2CO_3); soda-ash: the latter being the common name of the commercial article, one of the most, if not the most, important of all the products of chemical manufacture. Various hydrated carbonates of sodium occur in nature—the decahydrate or natron; the monohydrate, known as *thermonatrite*; and trona, a compound of the sesquicarbonate and the bicarbonate with three equivalents of water. These natural carbonates occur in solution in the water of various alkaline lakes, or as deposits at the bottoms of such as have become dried up, but usually mixed with more or less common salt, sodium sulphate, and other saline combinations. It was from these deposits, and from the incineration of various plants growing by the sea-shore (*Salsola*, *Salicornia*, *Chenopodium*, *Statice*, *Reaumuria*, *Nitraria*, *Tetragonia*, *Mesembryanthemum*), that soda was formerly obtained. These sources have become of little importance since artificial soda began to be made from common salt, a process invented by Leblanc, and put in operation near Paris toward the end of the eighteenth century. By this process common salt is decomposed by sulphuric acid, and the resulting sodium sulphate is mixed with limestone and coal, and heated in a reverberatory furnace, the product (technically known as *black ash*) consisting essentially of soluble sodium carbonate and insoluble calcium sulphid, which are easily separated from each other by lixiviation. By the Leblanc process the soda used in the arts was almost exclusively produced until about thirty years ago, when the so-called ammonia or Solvay process began to become of importance. This process had been patented in England as early as 1838, and tried there and near Paris, but without success. The difficulties were first overcome by E. Solvay, who in 1861 established a manufactory of soda by this process (since known by his name) near Brussels. By the ammonia or Solvay process a concentrated solution of common salt is saturated with ammonia, and then decomposed by carbonic acid. By this means sodium chlorid is converted into sodium carbonate, and the ammonia is afterward recovered by the aid of lime or magnesia. This process has within the past few years become of great importance, and at the present time about half the soda consumed in the world is made by it. Whether it will eventually entirely supplant the Leblanc process cannot yet be stated. The chief advantage which it presents is that the amount of coal consumed by it is much smaller than that required by the older process, so that countries where fuel is not very cheap and abundant can now make their own soda, being no longer dependent on England, as they were in large degree before the Solvay process became successful. For the properties of pure soda, see *sodium carbonate*, under *sodium*. Also called *mineral alkali*.

sodium (sō'di-um), *n.* [= *F. G. sodium* = *Sp. Pg. It. sodio*, *< NL. sodium*, *< soda + -ium*.] Chemical symbol, Na (natrium); atomic weight, 23. The metallic base of the alkali soda. See *soda* and *metal*. It was first isolated by Davy, in 1807, by electrolysis, and is at present obtained on a large scale by igniting sodium carbonate with charcoal. Sodium is a silvery-white metal with a high luster, but it oxidizes rapidly on exposure to moist air. Heated in the air, it burns rapidly with a bright-yellow flame, very characteristic of the metal; thrown into cold water, it oxidizes, but does not become hot enough to set the evolved hydrogen on fire, as potassium does; with hot water, ignition of the hydrogen takes place. Its specific gravity at 56° is 0.9735; at the ordinary temperature it has the consistency of wax; at 204° it melts, and forms a liquid resembling mercury in appearance. Next to silver, copper, and gold, it is, of the metals, the best conductor of heat and electricity; next to cesium, rubidium, and potassium, it is the most electropositive of the metals. It is extensively used in the laboratory as a powerful reducing agent: it is closely analogous to potassium in its chemical relations. Two of its compounds are very widely diffused in nature, and of the highest importance from various points of view: these are common salt and sodium carbonate, or soda.—**Sodium bicarbonate**, a compound having the formula NaHCO₃. It is a white crystalline powder, with a weaker alkaline taste than the other carbonate described below, and less soluble in water. Also called *soda saleratus*.—**Sodium borate**. See *borax*.—**Sodium carbonate**, a compound having the formula Na₂CO₃, either anhydrous or containing water of crystallization. (The method of manufacture is described under *soda*.) Anhydrous sodium carbonate, or chemically pure soda, is a white powder having an alkaline taste and reaction, readily soluble in water with evolution of heat. It fuses at a dull-red heat to a clear liquid. It is used in enormous quantities in the arts for a great variety of purposes. When crystallized from aqueous solution it forms transparent crystals, called *washing-crystals*, which contain ten equivalents of water. These effloresce on exposure to air.—**Sodium chlorid**, common salt, NaCl.

See *salt*, 1.—**Sodium line**, the bright-yellow line (strictly a double line) which incandescent sodium vapor gives when viewed by the spectroscope: it corresponds to the dark absorption line D (D₁ and D₂) of the solar spectrum.—**Sodium nitrate**. See *nitrate of soda*, under *nitrate*.

Solanaceæ (*sol-ā-nā'sē-ē*), n. pl. [NL. (Bartling, 1830), < *Solanum* + *-acæ*.] An order of gamopetalous plants, of the series *Bicarpellatæ* and cohort *Polemoniales*, characterized by regular flowers commonly with a plicate border, carpels with many ovules, and a straight, spiral, or coiled embryo in fleshy albumen. The sepals, petals, and stamens are each usually five, the ovary usually entire and two-celled, with an undivided style. In its plicate corolla the order resembles the *Convolvulacæ*, which are, however, unlike it in their few-seeded carpels and usually twining habit. Its other nearest ally is the *Scrophulariæ*, to which the tribe *Salpiglossidæ*, by its didynamous stamens and somewhat irregular flowers, forms a direct transition. The order includes about 1,750 species, perhaps to be reduced to 1,500, classed in 72 genera of 5 tribes, for the types of which see *Solanum*, *Atropa*, *Hyoisyanus*, *Cestrum*, and *Salpiglossis*. They are erect or climbing herbs or shrubs, or sometimes trees, and either smooth or downy, but rarely with bristles. They bear alternate and entire toothed or dissected leaves, often in scattered unequal pairs, but never truly opposite. The typical inflorescence is a bractless cyme, either terminal, opposite the leaves, or lateral, but not truly axillary, and sometimes converted into umbels or sessile clusters or reduced to a single flower. They are usually rank-scented and possess strongly narcotic properties, either throughout or in special organs, in *Mandragora* in the root, in most others strongly developed in the leaves, as in *belladonna*, tobacco, henbane, stramonium, and nightshade. In some, as the henbane, this principle is actively developed for a limited time only; in others, parts from which it is absent furnish a valued food, as the potato, tomato, and egg-plant, or a condiment, as Cayenne pepper. The order furnishes also several tonics and numerous diuretic remedies, as species of *Physalis*, *Nicantra*, *Cestrum*, and *Solanum*. Plants of this order are widely dispersed through warm climates of both hemispheres, extending beyond the tropics in North and South America, especially in the west, but less frequent in Europe and Asia. They are absent in alpine and arctic regions and in Australia. About 17 genera and 55 species are natives of the United States, chiefly in the southwest, and largely of the genera *Lucium*, *Solanum*, and *Physalis*. For other important genera, see *Lycopersicum*, *Capsicum*, *Datura*, *Nicotiana*, *Pelutia*, and *Solandra*.

solander² (*sō-lan'dér*), n. [*<* *Solander* (see quot. and *Solandra*).] A form of box designed to contain prints or drawings. See the quotation.

A *Solander* case is the invention of Dr. Solander, of memory dear to readers of "Cook's Voyages," who used one to contain and preserve specimens for natural history, drawings, and matters of the kind. It is really a box, generally shaped like a book, one side of which, turning on hinges, serves for a lid, while the front, or fore edge of the case, is furnished with hinges to be let down, so that the fronts as well as the tops of the contents can be got at.

Solandra (*sō-lan'drā*), n. [NL. (Swartz, 1787), named after Daniel Solander (born 1736, died about 1781), a Swedish botanist and traveler.] A genus of solanaceous plants, of the tribe *Atropææ*. It is characterized by solitary flowers with a long calyx-tube, an obliquely funnel-shaped corolla with broad imbricated lobes and induplicate sinuses, five stamens, and a two-celled ovary imperfectly four-celled by false partitions, forming in fruit a pulpy berry half-protruded from the torn membranous calyx. The 4 species are all American and tropical. They are lofty climbing coarse shrubby plants, with entire smooth fleshy and coriaceous shining leaves, clustered near the ends of the branches, and very large terminal white, yellowish, or greenish flowers on fleshy pedicels. *S. grandiflora*, *S. longiflora*, and other species are sometimes cultivated from the West Indies under the name *trumpet-flower*, forming handsome greenhouse evergreens, usually grown as climbers, or, in *S. longiflora*, as small shrubs.

Solanææ (*sō-lā-nē-ē*), n. pl. [NL. (A. L. de Jussieu, 1789), < *Solanum* + *-ææ*.] A tribe of plants of the order *Solanaceæ*. It is distinguished by flowers with the corolla somewhat equally plicate or divided into valvate or induplicate lobes, and having perfect stamens and a two-celled ovary which becomes an indehiscent berry in fruit, containing compressed seeds with a curved embryo and slender seed-leaves not broader than the radicle. It includes 31 genera, very largely natives of South America. For some of the most important, see *Solanum* (the type), *Capsicum*, *Lycopersicum*, and *Physalis*.

solanine (*sol'ā-nin*), n. [NL., < *Solanum* + *-ine*².] A complex body, either itself an alkaloid or containing an alkaloid, the active principle of bittersweet, *Solanum Dulcamara*. It is a narcotic poison.

solano (*sō-lā-nō*), n. [*<* Sp. *solano*, an easterly wind (cf. *solanazo*, a hot, violent easterly wind, *solana*, a sunny place), < L. *solanus* (sc. *ventus*), the east wind (usually called *subsolanus*), < *sol*, sun: see *sol*¹, *solar*¹.] The Spanish name of an easterly wind.

solanoid (*sol'ā-noid*), a. [*<* NL. *Solanum* + Gr. *eidos*, form.] Resembling a potato in texture: said of cancers.

Solanum (*sō-lā-num*), n. [NL. (Tournefort, 1700), < LL. *solanum*, the nightshade.] A genus of gamopetalous plants, type of the order *Solanaceæ*, the nightshade family, and tribe *Solanææ*. It is characterized by flowers usually with a deeply five- or ten-lobed spreading calyx, an angled or five-lobed wheel-shaped corolla, very short filaments with long anthers which form a cone or cylinder, open by a vertical pore or a larger chink, and are almost destitute of any connective, and a generally two-celled ovary with its conspicuous placentæ projecting from the partition. It is one of the largest genera of plants (compare *Senecio*), and includes over 950 published species, of which perhaps 750 are distinct. Their distribution is similar to that of the order, and they constitute half or two thirds of its species. They are herbs, shrubs, or small trees, sometimes climbers, of polymorphous habit, either smooth, downy, or woolly, or even viscid. They bear alternate entire or divided leaves, sometimes in pairs, but never truly opposite. Their flowers are yellow, white, violet, or purplish, grouped in panicle or umbel cymes which are usually scorpioid, sometimes apparently racemose, rarely reduced to a single flower. The species form two groups, the subgenera *Pachystemonum* and *Leptostemonum* (Dunal, 1813), the first unarmed and with broad anthers, the other with long anthers opening by minute pores, and commonly armed with straight spines on the branchlets, leaves, and calyx. South America is the central home of the genus, and of its most useful member, the potato, *S. tuberosum*, which occurs in numerous wild varieties, with or without small tubers on the rootstocks, from Lima to latitude 45° S. in Patagonia, and northward to New Mexico. (See *potato*, *potato-rot*, and *cuts under rotate* and *tuber*.) There are 15 native species in the United States, chiefly in the southwest, besides numerous prominent varieties and 5 introduced species. The seeds of many species are remarkably tenacious of life, and are therefore soon naturalized, especially the cosmopolitan weed *S. nigrum*, the common or black nightshade, the original type of the genus (for which see *nightshade*, and figure of leaf under *repand*); and compare *ointment of poplar-buds*, under *ointment*: from this the name *nightshade*

is sometimes extended to several other European species. For *S. Dulcamara*, the bittersweet, the other common species of the northeastern United States, a climber introduced for ornament, see *nightshade*, *yellowwort*, *dulcamara*, and *dulcamaria*. Two others in the United States are of importance as prickly weeds, *S. Carolinense* (for which see *horse-nettle*), a pest which has sometimes caused fields in Delaware to be abandoned, and *S. rostratum* (for which see *sand-bur*), of abundant growth on the plains beyond the Mississippi, and known as the chief food of the Colorado beetle or potato-bug before the introduction of the potato westward. The genus is one of strongly marked properties. A few species with comparatively inert foliage have been used as salads, as *S. nodiflorum* in the West Indies and *S. sessiliflorum* in Brazil; but the leaves of most, as of the common potato, bittersweet, and nightshade, are more or less powerfully narcotic. (See *solanine*.) The roots, leaves, seeds, and fruit-juices yield numerous remedies of the tropics; *S. jubarum* is strongly sudorific; *S. pseudoquina* is a source of quina in Brazil, a powerful bitter and febrifuge; others are purgative or diuretic, as *S. paniculatum*, the jerubeba of Brazil; *S. stramonifolium* is used as a poison in Cayenne. The berries are often edible, as in the well-known *S. Melongena* (*S. esculentum*) (for which see *egg-plant*, *brinjal*, and *aubergine*). Others with edible fruit are *S. aviculare* (see *kangaroo-apple*), *S. Uporo*, the cannibal-apple or borodina of the Fiji and other Pacific islands, with large red fruit used like the tomato, *S. vesum*, the gungany of southeastern Australia, *S. album* and *S. Athiopicum*, cultivated in China and southern Asia, *S. Gilo* in tropical America, *S. muricatum*, the pepino or melon-pear of Peru, and *S. racemosum* in the West Indies. *S. Quitoense*, the Quito orange, yields a fruit resembling a small orange in color, fragrance, and taste. *S. Indicum* (*S. Anguini*) is known as *Madagascar potato*, and *S. crispum* of Chili as *potato-tree*. Some species bear an inedible fruit, as *S. mammosum*, the macaw-bush (which see), also called *sunbush* and (together with *S. torum*) *turkey-berry*. For *S. Bahamense*, see *cankerberry*, and for *S. Sodomæum*, see *Sodom-apple*. Other species yield dyes, as *S. gnaphalioides* in Peru and *S. Vespertilio* in the Canaries, used to paint the face; *S. Guineense*, used to dye silk violet; and *S. indigoferum*, in cultivation in Brazil for indigo. *S. marginatum* is used in Abyssinia to tan leather; and the fruit of *S. saponaceum* is used as soap in Peru. Several species have been long cultivated as ornaments for their abundant red or orange berries, as *S. Pseudo-capsicum*, the Jerusalem cherry or winter-cherry (see *cherry*), and the Brazilian *S. Capsicastrum*, the dwarf winter-cherry or star-capsicum. Many others are now cultivated as ornamental plants, and are known by the generic name *Solanum*, as *S. Karstenii*, from Venezuela, with violet flowers; *S. betaecum*, a small pink-flowered fleshy South American tree with fine scarlet egg-like fruit; and *S. lanceolatum*, with narrow willow-like leaves, reputed the most showy blooming species. Others are cultivated for their conspicuous foliage, as *S. crinitum* and *S. macranthum*, with leaves 2½ feet long; *S. robustum*, clad in showy red down; and *S. Warszewiczii*, with handsome flowers and large leaves elegantly cut. The climber *S. jasminoides*, the jasmine-solanum, is a house-plant from Brazil, esteemed for its large and abundant clusters of fragrant white or bluish flowers.

The animal has the tentacles nearly united at the base; eyes on the upper part of the outer side of their base; the proboscis long, cylindrical, completely retractile; and the shell conical and generally declivous from the apex, with carinated margin of the last whorl, and a deep umbilical cavity, recalling a spiral staircase. The species inhabit tropical seas. They are rather large and generally handsome shells, some of which are common parlor ornaments. See *cut under Solarium*.

The corresponding sun-star of the North Pacific is *S. decemradiatus*.

Solasteridae (sō-las'tēr-i-dē), *n. pl.* [NL., < *Solaster* + *-idae*.] A family of starfishes, typified by the genus *Solaster*. The limits of the family vary, and it is sometimes merged in or called *Echinasteridae*. There are several genera, most of them with more than five rays, as in *Solaster*. In *Cribella* (or *Cribrella*) the rays are six. A fusible alloy used for joining or binding together metal surfaces or joints, as the edges of tin cans, jewelry, and kitchen utensils. Being melted on each surface, the solder, partly by chemical attraction and partly by cohesive force, binds them together. After cleaning the edges to be joined, the workman applies a solution of zinc in hydrochloric acid and also powdered rosin to the cleaned surfaces; then he touches the heated soldering-iron to the rosin, and holding the solder-bar and iron over the parts to be joined melts off little drops of solder at intervals along the margins, and runs all together with the hot iron. There are many of these alloys, as soft solder used for tinware, hard solder for brass and iron, gold solder, silver solder, spelter solder, plumbers' solder, etc. Every kind is used at its own melting-point, which must always be lower than that of the metals to be united, soft solders being the most fusible.

To solder such gold, there is a proper glew or soder. *Holland, tr. of Pliny*, xxxiii. 5.

Cf. *soil*¹, *sole*².] 1. The bottom or under side of the foot; technically, the planta, corresponding to the palm of the hand. The sole of ordinary language does not correspond well with *planta*, except in the cases of plantigrades. In digitigrades *sole* usually means only that part of the planta which rests upon the ground in ordinary locomotion, or the balls of the toes collectively; it also applies to the fore as well as the hind feet of such quadrupeds, thus including the corresponding parts of the *palm*, or palm; while the *planta* may extend far up the hind leg (only), as to the hock of the horse. In the horse sole is restricted to the under side of the hoof of either fore or hind feet (see *def. 4 (b)*). In birds the sole of the foot is the under side of the toes taken together. See *planta*, and cuts under *plantigrade*, *digitigrade*, *scutellipplanlar*, and *solidungulate*.

The common sole of Europe is *S. vulgaris*, formerly *Pleuronectes solea*. The body is elongate-oval, and has been

compared to the form of a human sole; the dorsal and anal fins are very long, but free from the caudal, which has a rounded end, and pectorals are developed on both sides; the mouth is moderately decurved; the nostrils of the blind side are not dilated; and the height of the body is a little less than a third of the total length. The color is a dark brown, with a black spot at the end of the pectoral fin. This sole is common along the European coasts, and is one of the most esteemed of food-fishes. The flesh is white, firm, and of excellent flavor, especially when the fish has been taken in deep water. The average weight is about a pound, although the fish occasionally reaches a much larger size. It prefers sandy or gravelly shores, but retires into deep water when frost sets in. It feeds chiefly upon mollusks, but also on the eggs of fishes and other animals. It sometimes ascends into fresh water. There are other species, of several different genera, as *Achirus lineatus*, commonly called *hog-choker*. The name *sole* is also given to various species of the related family *Pleuronectidae*. Along the Californian coast the common sole is a pleuronectoid, *Lepidopsetta bilineata*, which reaches a length of about 20 inches and a weight of five or six pounds, although its average weight as seen in the markets is about three pounds. In San Francisco only about two per cent. of the flatfishes caught belong to this species, but along Puget Sound it constitutes about thirty per cent. of the catch. It feeds chiefly on crustaceans and small fishes, and is regarded as an excellent food-fish. Other *Pleuronectidae* called soles along the Pacific coast of North America are the *Parophrys retulus* and *Hippoglossoides jordani*. See also cuts under *Pleuronectidae* and *Soleidae*.

Solenoid.

The ends of the wire are brought to the middle point, and when a current is passed through the circuit the solenoid behaves, as far as external action is concerned, like a long and thin bar magnet. For this reason, such a magnet is called a *solenoid magnet*; and Ampère's theory of magnetism is based on the assumption that magnets and solenoidal systems of currents are fundamentally identical.

A magnetic *solenoid* is an infinitely thin bar of any form longitudinally magnetized with an intensity varying inversely as the area of the normal section [that is, the cross-section perpendicular to the length] in different parts. *J. E. H. Gordon, Elect. and Mag., I. 157.*

An anterior high short spinous dorsal and a posterior low one are widely separated; the pectorals are inserted low on narrow bases, and the caudal is well developed. In Scotland *solicitors* are of two classes—*solicitors* in the supreme court, who occupy a position similar to that of *solicitors* in England; and *solicitors* at law, who are members of a society of law-agents at Edinburgh, incorporated by royal charter and entitled to practise before inferior courts; they are also known by the name of *procurators*. =Syn. 1. Dense.—8. Stable, weighty, important.

II. n. 1. A body which throughout its mass (and not merely at its surface) resists for an indefinite time a sufficiently small force that tends to alter its equilibrium figure, always springing back into shape after the force is removed; a body possessing elasticity of figure. Every such body has limits of elasticity, and, if subjected to a strain exceeding these limits, it takes a set and does not return to its original shape on being let go. This property is called *plasticity*. The minimum energy required to give a set to a body of definite form and size measures its resilience. When the resilience of a body is small and masks its springiness, the body is called *soft*. Even fluids transmit shearing forces if time be allowed, and many substances will yield indefinitely to very small (but not indefinitely small) forces applied for great lengths of time. So solids that have received a small set will sometimes partially recover their figures after a long time. This property in fluids is called *viscosity*, in solids *after-effect* (German *nachwirkung*). The phenomenon is connected with a regrouping of the molecules, and indicates the essential difference between a solid and a liquid. In fluids diffusion is continually active, and in gases it produces phenomena of viscosity. In liquids it is not rapid enough to give rise to sensible viscosity, but the free motion of the molecules makes the body fluid, while the tendency of sets of molecules to continue for a while associated makes the fluidity imperfect. In solids, on the other hand (at least when not under strain), there is no diffusion, and the molecules are consequently in stationary motion or describing quasi-orbits. They thus become grouped in the mode in which they have least positional energy consistent with their kinetic energy. When this grouping is slightly disturbed, it tends to restore itself; but when the disturbance is greater, some of the molecules will tend to return to their old places and others to move on to new situations, and this may give rise to a new permanent grouping, and exhibit the phenomenon of plasticity. But if not quite sufficient for this, disturbances of the molecular motions somewhat similar to the secular perturbations of the planets will result, from which there will be no restoration for a very long time. Solid bodies are very strongly cohesive, showing that the molecules attract one another on the whole; and they are generally capable of crystallization, showing that the attractions of the molecules are different in different directions.

2. In *geom.*, a body or magnitude which has three dimensions—length, breadth, and thickness—being thus distinguished from a *surface*, which has but two dimensions, and from a *line*, which has but one. The boundaries of solids are surfaces. Besides the three round bodies (the sphere, cone, and cylinder), together with the conoids, and the pyramids, prisms, and prismatoids, the most important geometrical solids are the five Platonic and the Kepler-Poinsot regular polyhedra, the two semi-regular solids, and the thirteen Archimedean solids. The faces, edges, or summits of one solid are said to correspond with the faces, edges, or summits of another when the radii from the center of the for-

(12 to 24 are the Archimedean solids.)

mer to the mid-faces, mid-edges, or summits can be simultaneously brought into coincidence with the radii from the center to the mid-faces, mid-edges, or summits of the latter. If two solids correspond faces to summits, summits to faces, and edges to edges, they are said to be *reciprocal*. If to the edges of one solid correspond the faces or summits of another, while to the faces and summits together of the former correspond the summits or faces of another, the latter is said to be the *summital* or *facial holohedron* of the former. The regular tetrahedron is the reciprocal of itself, and its reciprocal holohedra are the cube and octahedron. The reciprocal holohedra of these, again, are the semi-regular dodecahedron and the cuboctahedron. The facial holohedron of these, again, is the small rhombicuboctahedron. The faces of the truncated cube and truncated octahedron correspond to those of the cuboctahedron. The snub-cube has faces corresponding to the cuboctahedron, and twenty-four faces which in two sets of twelve correspond to the summits of two other cuboctahedra. The faces of the great rhombicuboctahedron correspond to those of the small rhombicuboctahedron. Just as the cube and octahedron are reciprocal, so likewise are the Platonic dodecahedron and icosahedron, though they are related to no hemihedral body like the tetrahedron. Their reciprocal holohedra are the semi-regular triacontahedron and the icosidodecahedron, and the facial holohedron of these, again, is the small rhombicosidodecahedron. The faces of the truncated dodecahedron and truncated icosahedron correspond to those of the icosidodecahedron. The snub-dodecahedron has faces corresponding to those of the icosidodecahedron, and two sets of others corresponding to the summits of two other icosidodecahedra. The faces of the great rhombicosidodecahedron correspond to those of the small rhombicosidodecahedron. The faces, summits, and edges of the great icosahedron and great stellated dodecahedron correspond respectively to the faces, summits, and edges of the Platonic dodecahedron and icosahedron. The great dodecahedron and small stellated dodecahedron are self-reciprocal, both faces and summits corresponding to the faces of the Platonic dodecahedron or summits of the icosahedron. The faces of the truncated tetrahedron correspond to the faces of the octahedron or summits of the cube.

3. *pl.* In *anat.*, all parts of the body which are not fluid: as, the *solids* and fluids of the body. —4. *pl.* In *printing*, the parts of an engraving which show black or solid in print.—*Archimedean, rectangular, right solid.* See the adjectives.—*Cissoidal solid*, a solid generated by the rotation of the cissoid about its axis.—*Kepler solid*, or *Kepler-Poinsot solid*, a regular solid which inwraps its center more than once. There are four such solids—the great icosahedron, the great dodecahedron, the small stellated dodecahedron, and the great stellated dodecahedron. Three of them were mentioned by Kepler, and all were rediscovered by Poinsot. The names here used were given by Cayley.—*Logistic solid*, a solid generated by the revolution of a logarithmic curve about its asymptote.—*Plastic solid*, a solid substance whose limit of elasticity is far below its point of rupture, so that it can be shaped: thus, putty and wrought-iron are *plastic solids*.—*Platonic solid*, one of the old regular solids which inwrap the center only once. They are five—the tetrahedron, the cube, the octahedron, the twenty-vertexed dodecahedron, and the icosahedron.—*Regular solid*, a polyhedron whose faces are regular polygons, all alike.—*Semi-regular solid*, a body whose edges are all of equal length, whose faces are all alike and equally incline to one another at the edges, but whose faces are not regular polygons. Two such solids are known—the rhombic dodecahedron and triacontahedron.—*Solid of least resistance.* See *resistance*.—*Solid of revolution.* See *revolution*.

Solidago (sol-i-dā'gō), n. [NL. (Vaillant, 1720), < ML. *solidago*, goldenrod (*Solidago Virgaurea*), so called from its reputed vulnerary qualities, < L. *solidus*, solid; see *solid*.] 1. A genus of composite plants, the goldenrods, of the tribe *Asteroidæ* and subtribe *Homochromæ*, sometimes made the type of a further subdivision, *Solidaginæ* (De Candolle, 1836). It is characterized by several-flowered small and radiate yellow heads, with a small flat usually alveolate receptacle, and an oblong involucre of erect rigid bracts which are closely imbricated in several rows and are without herbaceous tips. The oblong or obovoid five- to twelve-ribbed achenes bear a copious whitish pappus of long and nearly equal slender bristles. From *Aster*, which it closely resembles in technical characters, it is distinguished by its taller wand-like habit, yellow rays, smaller heads, and the absence of cordate leaves; from *Chrysopsis* and *Haplopappus* by its narrow few-flowered heads; and from *Bigelovia*, its other most

Solidago

important near relative, by the presence of rays. The species have in general a very characteristic habit, being perennial herbs, usually with strictly erect unbranched stems, which bear numerous entire or serrate alternate sessile narrow stem-leaves and broader root-leaves, which taper into margined petioles. Numerous intermediate forms render many species difficult to distinguish. In the original species, *S. Virgaurea*, the golden-yellow flowers are massed in small clusters which form an elongated or interrupted spike, whence the popular name *goldenrod*. The typical inflorescence, however, is a terminal pyramidal panicle of determinate development, composed of numerous recurving and scorpioid one-sided racemes, best seen in *S. Canadensis* and *S. rugosa*. In other species the flowers form a dense thyrsus of straight and terete crowded racemes, as *S. speciosa*, of the Atlantic and interior United States. A few others from the Ohio and Mississippi valleys, as *S. rigida*, produce nearly level-topped cymes. Four other cymose species were formerly separated as a genus, *Euthamia* (Nuttall, 1818), distinguished by lack of scorpioid branchlets and by their linear entire one- to five-nerved leaves, including the widely distributed species *S. lanceolata* and *S. Caroliniana* (*S. tenuifolia*), and connecting with *S. pauciflorula*, of the Southern States and the Bahamas, formerly separated as a genus, *Chrysoma* (Nuttall, 1840), because of its shrubby stem and few-flowered heads with one to three rays. Several other species are slightly aberrant: *S. multiradiata*, of the Rocky Mountains, sometimes has twelve rays, others usually five; *S. discolor*, a racemose Gulf species, is wholly without rays and has a purplish pappus; this, with *S. squarrosa* of northern rocks and *S. petiolaris* of southern pine-barrens, varies also in the spreading tips of the involucre bracts. *S. bicolor* is remarkable for its cream-colored flowers. *S. verna*, of pine-woods near Wilmington, North Carolina, blooms in May; *S. uliginosa*, of northern peat-bogs, in July; *S. juncea* and *S. elliptica* in August; and *S. rugosa*, *S. Canadensis*, and most others mainly in September; *S. nemoralis* and *S. æ-*

cia continue well into October. The genus is one of the most characteristic of the United States, numerous both in species and in individuals, and not entirely wanting in any region. In the northern and central States it gives to the landscape much of its beauty, and is an important element of the prevailing yellow of autumn. There are nearly 100 species, of which 80, besides more than 30 important varieties, are natives of the United States, and the others are nearly all American, 9 of them occurring in Mexico, 2, 3, or 5 in South America (3 in southern Brazil, 2 in Uruguay, and 1 in Chili), and 1 in Hayti. Only 2 species are natives of the Old World, *S. litorea*, limited to the Tuscan and Ligurian coast, and *S. Virgaurea*, which extends from Mount Parnassus north and west throughout Europe and into Siberia, Alaska, New York, and New England, in many widely differing varieties. Those of the United States are all, with 5 exceptions, confined to them and to British America (into which 32 extend), and are mainly natives of the Atlantic and central States. Numerous isolated species are southern; the northern are mostly of wider distribution and more abundant in individuals; 11 species are mainly confined to the high northern, 12 to the northeastern, 24 to the southern, 8 to the southwestern, 10 to the Pacific States; 6 belong to the Mississippi valley, of which *S. Missouriensis* is the only one widely distributed; 2 species, *S. odora* and *S. sempervirens*, extend throughout the Atlantic coast from Canada to Mexico, and the latter, the salt-marsh goldenrod, reappears at the Azores and at San Francisco. Forty-two species occur in the northeast quarter of the United States, 53 in the Southern States, and about 14 among the Rocky Mountains. *S. Canadensis*, the most numerous and most typical species, is also the one most widely diffused through the United States, followed next by *S. nemoralis* and *S. rugosa*. The species of this genus range from beyond 66° N. latitude to the city of Mexico, and from alpine summits to the sea-level; several are mostly confined to swamps, as *S. patula*, and a few to woodland borders, as *S. cænea* and *S. bicolor*, but most are plants of dry open soil, especially *S. nemoralis*. In parts of the Atlantic coast the name *goldenrod* is locally confined to *S. odora*, the sweet goldenrod of authors, which contains in its dotted leaves an aromatic and stimulating volatile oil of an anisate odor and pale greenish-yellow color; it is also carminative and diaphoretic, and its infusion is used to relieve spasmodic pains and nausea; its dried flowers and leaves have been employed as a beverage, under the name of *Blue-Mountain tea*. *S. Virgaurea*, the goldenrod of Europe, contains an astringent and tonic principle, and was long in esteem for healing wounds,

herbalists of two and three centuries ago pronouncing it "one of the most noble wound-herbs," and prescribing "a tea of the young leaves, green or dry." It was also once in repute in Europe as a dye, and a variety of *S. nemoralis* is locally called *dyer's-weed* in America. *S. Canadensis* and others have been popularly known as *yellow-weed*, and *S. rugosa* as *bitterweed*. *S. rigida* is also a reputed astringent. The goldenrod has been recommended by many as the national emblem of the United States.
