rifle² (rif'li), *n.* [Short for *rifled gun*: see *rifle*², *v.* Cf. Sw. *refleboissa*, a rifled gun. The Dan. *riffler*, Sw. *rifle*, a rifle, are < E.] 1. A firearm or a piece of ordnance having a barrel (or barrels) with a spirally grooved bore. Spirally grooved gun-barrels are of German origin; some authorities think they were invented by Gaspard Koller of Vienna, in 1498; others regard Augustus Kottler of Nuremberg as the originator, the invention, according to these writers, dating between 1500 and 1520. Straight grooves were used in the fifteenth century, but their purpose was simply to form recesses for the reception of dirt and to aid in cleaning the gun. Spiral grooving has a distinct object beyond this, namely, to impart to the projectile a rotation whereby its flight is rendered more nearly accurate—the principle being that, when the center of gravity in the bullet does not exactly coincide with its longitudinal axis, as is nearly always the case, any tendency to deviate from the vertical plane including that axis will, by the constant revolution of the bullet, be exerted in all directions at right angles with its geometrical axis. A variety of shapes in the cross-sections of the grooves have been and are still used. The number of grooves is also different for different rifles, as is the pitch of the spiral—that is, the distance, measured on the axis of the bore, included by a single turn of the spiral. The variation in small arms in this particular is wide—from one turn in 17 inches to one turn in 7 feet. In ordnance the pitch is much greater. Breech-loading guns began to appear in the first half of the sixteenth century, and were probably either of French or German origin. Such guns were made in Italy in the latter half of the sixteenth century. During the war of independence in America, a breech-loading rifle invented by Major Patrick Ferguson, and known as the Ferguson rifle, was used; it was the first breech-loading carbine used in the British regular army. A great many breech-loading rifles have since appeared. Muzzle-loading rifles have been superseded as military arms by these guns, and to a large extent the latter have supplanted muzzle loaders for sporting arms. Many breech-loaders once of importance in American and European warfare have in their turn been superseded by improved arms. Among them is the once justly celebrated Prussian needle-gun. These improvements have culminated in the Winchester and other repeating arms, which admit of refined accuracy of aim with great rapidity of firing. The tendency in modern rifles is toward smaller bores and chambers. The most recent advance in this direction of improvement is of German origin (1889-90), and consists in making rifles of much smaller bore and less weight than have hitherto been used, with bullets of lead and wolfram alloy having a specific gravity 50 per cent. greater than that of the lead and antimony alloy of the common hardened rifle-bullets. The bores of guns with which experiments have been made are less than 8 millimeters in diameter. Some having bores only 4 millimeters (about 1/4 inch) in diameter

have been tried with surprising increase of range and effectiveness, on account of the diminished air-resistance. Exclusive of repeating rifles or magazine-guns, the principal differences between modern rifles are in their breech-actions and their firing-mechanism. Some of the more important of these arms are described below.

2. A soldier armed with a rifle: so named at a time when the rifle was not the usual weapon of the infantry: as, the Royal Irish Rifles—that is, the 83d and 86th regiments of British infantry.—**Albini-Braendlin rifle**, the firearm of the Belgian government. The breech-block is opened in the manner explained for the Berdan rifle. In closing, after insertion of the cartridge, the block is fastened by a spring stud until the hammer strikes. The hammer in striking operates a locking-bolt, sliding it longitudinally into the breech-block, thus preventing the latter from rising under the stress at the instant of discharge. The spent cartridge is extracted as in the Berdan rifle, the extractor-claws being attached to the breech-block, and engaging the cartridge-case when the block is turned forward over the barrel. The cartridge is also exploded as described for the Berdan rifle. The hammer strikes and drives the locking-bolt forward against a striker or needle in the breech-block, which impinges against the base of the cartridge.—**Berdan rifle**, a combination of the Albini-Braendlin and the Chassepot rifles (which see). It is named after its inventor, an American, General Berdan. It has a hinged breech-block, which, when turned forward over the barrel, extracts the spent cartridge. A new cartridge having been inserted, the block is closed, and fastened by a bolt analogous to the cock of the Chassepot rifle. The lock has a spiral mainspring which drives the locking-bolt against a striker working in the center of the breech-block, instead of at the side as in the Albini-Braendlin gun. This rifle was used in the American civil war, and is still one of the United States arms. It has been adopted by the Russian government, which now manufactures an improved pattern of the gun at its arsenal at Tula. The arm is hence called in Europe the Berdan-Russian rifle.—**Breech-loading rifle**, in distinction from muzzle-loading rifle, a rifle that is charged at the breech instead of at the muzzle.—**Chassepot rifle**, a French modification of the Prussian needle-gun (which see). The barrel has four deep grooves with a left-handed instead of a right-handed spiral, this direction being chosen to counteract the disturbing effect of the pull-off on the aim. The self-consuming cartridge was originally used, but, this causing the gun to foul quickly, the arm (which is still retained by the French government) has been adapted to the use of metallic cartridges.—**Double rifle**, a double-barreled rifle. Such rifles have hitherto been used only as sporting guns.—**Enfield rifle**, a muzzle-loading gun formerly manufactured by the English government at Enfield. Several systems having been submitted by different gun-makers, the government, instead of using any one exclusively, adopted the best points of each, and combined them in this arm. The gun in its original form is still used by native regiments in India, but it has been converted into a breech-loader, and is called the "Snider Enfield" or "Snider rifle." It is, except in India, now superseded.—**Express-rifle**. See *express*, n. 5.—**Francotte-Martini rifle**, a gun having the Martini breech-action with an important modification by M. Francotte of Liège, whereby the lock-mechanism may be, for cleaning, all removed at once from below, by taking out a single pin from the trigger-plate and guard to which the lock-work is wholly attached, and by which it is supported in the breech-action body.—**Henry repeating rifle**, a gun in which a magazine for cartridges extends under the entire length of the barrel, and holds fifteen cartridges. It can be fired thirty times per minute, including the time necessary to supply the magazine. The Winchester rifle has superseded this arm, which was one of the weapons used in the United States army during the American civil war.—**High-powered, low-powered rifles**. See *powered*.—**Mannlicher repeating rifle**, a name of two different guns, one of which is a revolving-magazine repeater, and the other a detachable-magazine repeater. The revolving magazine in the first-named consists of three joined parallel tubes, each holding a number of cartridges, the whole being automatically revolved on a central axis as each tube is emptied, to bring one after another into the proper position for delivering the cartridges. The magazine is contained in a chamber formed in the butt of the stock, and it is loaded through an opening in front of the guard. The cartridges are successively fed forward by a spiral spring, and automatically thrown up into a horizontal position and forced into the breech of the barrel while placing the lock in the firing position. The cartridges are metallic and central-fire, but are necessarily of rather small caliber. The other Mannlicher rifle has a detachable magazine, but the breech-mechanism is the same. The magazine is fixed to the shoe of the breech-action, and, when detached, is used as a cartridge-pouch. Several magazines, each with eight or ten cartridges, can be loaded, and, when needed, successively and quickly attached. This arm has been adopted in the Austrian army.—**Martini-Henry rifle**, a rifle adopted by the English government, rifled on the Henry principle described under *rifling*, and having its breech-action that of Martini, in which the breech-block is hinged, and opened backward by pushing downward and forward a lever pivoted just back of the trigger-guard, which movement also automatically extracts the cartridge-case. The gun has been slightly improved since its adoption. It is now used with a coiled brass bottle-necked cartridge carrying a large charge of powder. It shoots accurately at 800 yards, but has a range of 1,500 yards.—**Match-rifle**, a fine, well-made arm used for match-shooting. The grain of the barrel is generally parallel with the axis of the bore, which secures greater accuracy in rifling than is possible in a twist barrel. The grooves are also very shallow. For different English muzzle-loading match-rifles (still somewhat used), the Whitworth, Henry, and rectangular-grooved rifling (which see, under *rifling*) are variously employed. For breech-loaders, either the Metford system or the American method (also described under *rifling*) is more in vogue. The sights of match-rifles are usually a wind-gage fore-sight and an elevating vernier peep-sight.—**Minie rifle**, a rifle using the Minie ball.—**Muzzle-loading rifle**, a rifle which is

charged or loaded at the muzzle, as distinguished from a breech-loading rifle.—**Peabody-Martini rifle**, a breech-loading military firearm, made at Providence, Rhode Island. It is a modification of the English Martini-Henry rifle, and is adopted by the armies of Turkey and Rumania.—**Peabody rifle**, the first breech-loader which used a dropping breech-block pivoted at the rear end above the axis of the bore. The operating lever is also the trigger-guard, and is connected with the block in such manner that pressing it forward pulls downward the front end of the block, thus rendering it impossible to jam the block by any expansion of the cartridge at the base, as sometimes has occurred in rifles wherein the whole block slides downward below the bore. This breech-action appears to have been the forerunner of the breech-actions of the Martini, Westley-Richards, Swinburne, Stahl, Field, and other arms that have appeared since 1862 (the year in which the Peabody rifle was first submitted to military tests at the United States arsenal in Watertown).—**Photographic rifle**, a fanciful form of camera arranged for taking instantaneous photographs of objects in motion. It is a camera fixed on a gun-stock, with sights to secure accuracy in bringing the desired object within the field of the lens, and a trigger for setting free the instantaneous shutter to make the exposure. It has no practical use, being merely a very clumsy form of hand-camera or detective camera.—**Remington rifle**, an arm extensively used in the armies of the United States, France, Denmark, Austria, Italy, China, Egypt, and many South American governments. The bore has been made either to take a bottle-necked cartridge, as do the Martini-Henry and some ex-

In loading, C is drawn back till caught by e in second notch of C. This enables B to be drawn back, opening the cartridge-chamber. The pulling back of C extracts the cartridge by an extractor not shown in the cut. The shell is then taken out and a new cartridge inserted by hand. B is then closed against the loaded chamber, leaving the gun cocked. Pulling the trigger then releases C, which drives the firing-pin against the cartridge.

press-rifles, or a Berdan cartridge. The breech-action of the earlier patterns has been criticized as lacking solidity, but no other military rifle has ever proved more generally satisfactory in use. The construction is remarkably simple. The breech-action of earlier patterns consisted mainly of two pieces—a combined breech-piece and extractor, and a hammer breech-bolt. Each of these parts works upon a strong center-pin with a breech-bolt to back up the breech-piece, and a spring holds the latter till the hammer falls. The action has, however, been much improved in later models, and the earlier defects removed. The breech-block is actuated by a side-lever, and it is locked independently of the hammer. It is provided with a powerful and durable extractor, and the lock-mechanism is both simple and strong. The Remington-Lee rifle, shown in the cut, was adopted by the government of Great

Britain in 1889. In the present United States government caliber (.45) the gun has been officially adopted by the United States Navy Department.—**Repeating rifle**, a rifle which can be repeatedly fired without stopping to load. Such arms are constructed either on the revolving principle (see *revolver*) or the magazine principle, or, as in the Needham and the Mannlicher systems, they comprise both these principles.—**Rook and rabbit rifle**, a small breech-loading sporting rifle, used only for short ranges. The Remington, the Martini, and also top-lever and side-lever actions are variously used in such guns, and they generally have half or full pistol-hand stocks. When side-lever actions are used, they have rebounding locks (which see, under *lock*).—**Saloon rifle**, a small smooth-bore, breech-loading gun, incongruously named, having a strong heavy barrel, and used for ranges of from 50 to 100 feet. The cartridge is a small copper case charged with a fulminate. Such guns are principally used in shooting-galleries or rifle-saloons. The best of these guns shoot with remarkable accuracy, and hence are called by the French "carabines de précision."—**Schneider repeating rifle**, a gun having a reciprocating block like the Sharp's rifle, the block moving down vertically, instead of being pivoted on hinges and turning downward as in actions of rifles of the Peabody type. It has a tubular magazine with a spring-coil feed extending under the barrel. The breech-block is depressed by moving an under lever downward and forward, and at the lowest position of the lever a cartridge is delivered rearward upon the top of the block. The lever is then moved back, which lifts the cartridge into line with the bore, on arriving at which it is automatically thrust into the breech by a swinging cam on the left side of the breech-block. This cam also acts as the extractor when the breech is again

opened. A link connecting the lever and hammer cocks the gun.—**Schulhof repeating rifle**, a gun having a striker of the bolt form, resembling that of the Chassepot and other guns of that class, a spacious and handy magazine in the stock-butt, a peculiar and efficient cartridge-carrier, and a trigger unlike that in any other rifle. The trigger is on the top of the grip of the stock, and is pressed instead of pulled in firing. Turning over the breech-block and drawing it rearward cocks the gun, and at the same time brings a cartridge into position for insertion; closing the block thrusts in the cartridge, leaving the gun cocked; pressing the trigger fires it. This is one of the most simple and rapid of repeating arms. Twenty-five well-aimed shots can be fired with it by an expert in 30 seconds.—**Sharp's rifle**, a rifle having a nearly vertical breech-block sliding in a mortise behind the fixed chamber in the barrel, and operated from below by a lever, which forms the trigger-guard. This gun was used in the American civil war, and was also used to a very limited extent in the British cavalry. It has now only historical importance.—**Snider rifle**, an Enfield rifle converted into a breech-loader. (Compare *Enfield rifle*.) In the change, two inches in length of the breech was cut away at the top, and a slightly tapered chamber made for the reception of the cartridge. A breech-block hinged on the right-hand side was used to close the opening thus made. This block closes down behind the cartridge and receives the recoil. The block is opened, and the cartridge pushed in by the thumb. A striker passes through the breech-block, and transmits the blow of the hammer to the fulminate. The general principle of the breech-action is among the earliest known in the history of breech-loading arms.—**Soper rifle**, an arm having a side-hinged swinging block like the Wendl (Austrian) breech-loading rifle. The block is, however, operated by a lever situated on the side of the stock in a position where it can be depressed by the thumb of the right hand, while the gun is at the shoulder, without moving the hand from the grip of the stock. The movement of the lever simultaneously opens the breech-block, extracts the cartridge, carries back the striker in the breech-block, and places the hammer at full cock. The cartridge is then inserted with the left hand, and on releasing the lever from pressure the breech-block closes. The gun is then ready to fire. The possible rapidity of firing with this gun is probably greater than that of any other breech-loader not of the repeating class.—**Sporting rifle**, in contradistinction to *military rifle*, one of a class of rifles specially designed for use in hunting. The class includes the express-rifle, double rifle, large-bore rifle, rook and rabbit rifle, punt-gun, etc.—**Springfield rifle**, a single breech-loader adopted and manufactured (at Springfield

When the breech-block is closed, the rear end of the ejector-spring spindle presses against the extractor. The drawing in full outline shows this position. When the breech-block is raised into the position shown in dotted outline, it presses against the lug m of the extractor f and turns f rearward, withdrawing the shell, and the ejector-spring is compressed; when the direction of the spindle and spring k passes to a point below the center of e, the extractor is thrown quickly and forcibly backward, throwing out the shell, the latter being deflected upward by the ejector-stud l.

in Massachusetts) by the United States government. The breech-fermeture consists of a rotating breech-block and a locking cam. It is fired by means of a side-lock and firing-pin. See the cut with explanation.—**Vetterlin repeating rifle**, a Swiss arm, of which its inventor, Vetterlin, has produced several patterns. Its firing-mechanism acts on the same principle as that of the Chassepot, but it has a magazine placed longitudinally under the barrel. The cartridges are respectively delivered rearward into a carriage which is moved upward into proper relation with the barrel by a bell-crank connected with the sliding-block when the latter is pulled backward, and descends again for another cartridge when the breech-block is closed. The extractor is similar to that of the Winchester rifle (see cut below). A coiled mainspring drives the needle against the base of the cartridge.—**Winchester rifle**, a repeating rifle which, like the Henry repeating rifle, has a magazine extending

pin and whose point is driven against the cartridge by the hammer at the instant of firing; *r*, the mainspring, connected by a link with the hammer below the hammer-pivot *m*; *v*, the sear with sear-spring and safety-catch mechanism (not lettered) situated behind it; *w*, the trigger; *x*, extractor and extractor-mechanism, the extractor engaging the rim of the cartridge in the barrel and pulling the spent cartridge-shell out when the breech-block is moved rearward. Turning the finger-lever *m*, *m*, *m*, *m* downward toward the front forces the breech-block, breech-pin, and hammer rearward, cocking the hammer and extracting the spent cartridge-shell. At the same time the ledge or abutment *l* on the finger-lever presses against the ledge *l* on the carrier-lever, forcing up the carrier *r* with its contained cartridge. When moved back to its original position the finger-lever permits the carrier to return to its original position and receive another cartridge from the magazine *f*, and also forces the breech-block *p* forward, pressing the cartridge into the breech of the barrel. The hammer remains cocked until the trigger is pulled. The loading of the gun and cocking for firing are thus effected by the single motion forward and rearward of the finger-lever *m*. The opening of a side plate (not shown) permits the charging of the magazine by successive insertions of cartridges.

longitudinally under the barrel, but is a stronger and lighter gun, and has a differently constructed magazine with improved mechanism for loading and unloading, and also a different cartridge-extractor.

rife³ (ri'f), *n*. [Origin uncertain.] 1. A bent stick standing on the butt of the handle of a scythe. *Hallivell*.—2. An instrument used after the manner of a whetstone for sharpening scythes, and consisting of a piece of wood coated with sharp sand or emery, with a handle at one end. [Local, Eng. and New Eng.]

rife-ball (ri'f-bál), *n*. A bullet designed to be fired from a rifle. Such balls are not now made spherical, as formerly, but generally cylindrical, with a conoidal head, the base being usually hollowed and fitted with a plug, which causes the bullet to expand into the grooves of the bore of the weapon. See *rifle*, *v. t.*, and *cut under bullet*.

rife-bird (ri'f-bèrd), *n*. An Australian bird of paradise, *Ptilorhis paradisea*, belonging to the slender-billed section (*Epimachinæ*) of the family *Paradisæidæ*: said to have been so named by the early colonists from suggesting by its colors the uniform of the Rifle Brigade. This bird is 11 or 12 inches long, the wing 6, the tail 4½, the bill 2; the male is black, splendidly iridescent with fiery,

purplish, violet, steel-blue, and green tints, which change like burnished metal when viewed in different lights; the female is plain brown, varied with buff, white, and black. The rifle-bird inhabits especially New South Wales. There are 3 or 4 other species of *Ptilorhis*, of other parts of Australia and some of the adjacent islands, of which the best-known is *P. magnifica* of New Guinea.

rife-corps (ri'f-kör), *n*. A body of soldiers armed with rifles. Especially, in England, since about 1857, a body of volunteers wearing a self-chosen uniform and undergoing drill by their own officers as part of a body of citizen-soldiers formed for the defense of the country.

W. W. Greener, *The Gun*, p. 157.

rifling¹ (ri'fling), *n*. [Verbal *n.* of *rifle*¹, *v.*] 1. The act of plundering or pillaging.—2. *pl.* The waste from sorting bristles.

rifling² (ri'fling), *n*. [Verbal *n.* of *rifle*², *v.*] 1. The operation of cutting spiral grooves in the bore of a gun.—2. A system or method of spiral

grooving in the bore of a rifle. Whatever may be the form of cross-section in the grooves, the modern practice is to make them, for small-arms, extremely shallow; and, though the rectangular form with sharp angles is still retained, the angles are commonly rounded, this being an easier form to keep clean. Henry's system of rifling, used in most military rifles, has seven grooves; and the grooves make one turn in 22 inches. The grooves are broad, rectangular, and very shallow, with rounded angles, the lands being much narrower than the grooves. This is the system used in the Martini-Henry rifle. The system most in vogue in America for match-rifles is that of a uniform spiral, one turn in 18 inches, with very shallow grooves. With shallow grooves, hardened bullets are required; and the method of shallow grooving, with hardened bullets, is now taking the place of deep grooves and soft bullets, which were characteristic of Whitworth's and Henry's system of rifling. In express-rifles the rifling is very shallow with a slow spiral (one turn in 4 feet to one turn in 8 feet); and six is considered the best number of grooves. The so-called "Metford system" of rifling, used in England for fine match-rifles, employs five extremely shallow grooves, each including about 32° of the circumference of the bore, the twist of the spiral increasing toward the muzzle, generally finishing with one turn in 17 inches; but it is part of this system to vary the spiral in different guns according to the character of the powder to be used. In large-bore rifles with shallow circular-arc-bottomed grooves, the grooves are often ten in number, with one turn in 7 feet. A system, still of doubtful expediency, has been introduced, called the *non-fouling system*. In this method the barrel is rifled in its front half only. Some very fine shooting has been done by guns thus rifled. The Whitworth system of rifling is that of a hexagonal bore with spiral faces. It is still retained for ordnance. The projectiles for such rifles are also hexagonal with twisted sides. The Hadden system of rifling for ordnance consists of three spiral grooves of deep elliptical cross-section, into which fit three wings on the front of the shot or shell. Other shapes of grooves are also used for ordnance.—**Batchet-rifling**, a kind of grooving in gun-barrels in which the grooves have a cross-section closely approximating a right-angled triangle with the hypotenuse at the bottom of the groove, like the spaces between the teeth of a ratchet. It is now used only for inferior guns.

rifling-machine (ri'fling-má-shēn'), *n*. A machine serving to cut spiral grooves or rifles in the surface of the bore of a small-arm or cannon. For small-arms, the cutter-head is armed with two or more cutters, and the grooves are cut in the pulling stroke of the rifling rod to prevent bending, no work being done on the return stroke. After every stroke the cutter-head or barrel is revolved a certain angular distance (depending on the number of grooves to be cut) by the automatic rotation of the rifling bar, so that the several grooves are successively occupied by each cutter. For cannon, the cutter-head fits the bore exactly, and the cutter projects above its cylindrical surface to a height equal to the depth of the chip to be taken out at each stroke, cutting but one groove at a time. The twist is obtained automatically by means of a rack and pinion. The pinion-wheel is made fast to the cutter-bar, and gears into a rack carrying two or three friction-wheels at one end. These friction-wheels roll upon an inclined guide, curved or straight according as the twist is to be increasing or uniform.

rifling-tool (ri'fling-töl), *n*. An instrument for rifling firearms.

The adjective *right* has a much wider signification than the substantive *Right*. Everything is *right* which is conformable to the Supreme Rule of human action; but that only is a *Right* which, being conformable to the Supreme Rule, is realized in Society, and vested in a particular person. Hence the two words may often be properly opposed. We may say that a poor man has no *Right* to relief, but it is *right* he should have it. 4. In *law*, that which any one is entitled to have, or to do, or to require from others, within the limits prescribed by law (*Kent*); any legal consequence which any person, natural or artificial, is entitled to insist attaches to a given state of facts; the power recognized by law in a person by virtue of which another or others are bound to do or forbear toward or in regard of him or his interests; a legally protectable interest. In this sense things possess no rights; but every person has some rights irrespective of power to act or to compel the acts of others, as, for instance, an idiot, etc.; and even the obligations of persons in being, in view of the possibility of the future existence of one not yet in being, are the subject of what are termed *contingent rights*. In this general meaning of *right* are included—(a) the just claim of one to whom another owes a duty to have that duty performed; (b) the just freedom of a person to do any act not forbidden or to omit any act not commanded; (c) the title or interest which one person has in a thing exclusive of other persons; and (d) a power of a person to appoint the disposition of a thing in which he has no interest or title. *Right* has also been defined as a legally protected interest. A distinction is made between *personal* and *real rights*. The former term is often used in English law for a right relating to personal, the latter for a right relating to real property. But in the language of writers on general jurisprudence and on civil law, a personal right is a right exclusively against persons specifically determined, and a real right is a right availing against all persons generally. By some writers a distinction is taken between *primary rights* and *sanctioning rights*, by the latter being meant the rights of action which the law gives to protect the primary rights, such as ownership, or contracts.

=*Syn* 1. *Righteous*, *Rightful*, *Upright*, *Just*; honest, equi-
table, fair; godly, holy, saintly. The first three of the Ital-
icized words go back directly to the first principles of right,
while *just*, though expressing quite as much conformity to
right, suggests more of the intricate questions arising out
of the relations of men. *Upright* gets force from the
idea of physical perpendicularity, a standing up straight
by the standard of right; *righteous* carries up the idea
of right to the standards, motives, and sanctions of religion;
rightful applies not to conduct, but to claims by
right: as, he is the *rightful* owner of the land; *just* sug-
gests by derivation a written law, but presumes that the
law is a right one, or that there is above it, and if neces-
sary overruling it, a law of God. This last is the uniform
Biblical usage. *Just* generally implies the exercise of some
power or authority. See *justice* and *honesty*.

("Commentary on the Epistle to the Galatians," *Introd.*)
and other Protestant theologians following him distinguish

between *active* and *passive righteousness*, the former consisting in what is right because it is right, the latter in accepting for Christ's sake by faith the free gift of righteousness as defined in the second definition above.—**Original righteousness**, in *scholastic theol.*, the condition of man as made in the image of God before the fall.—**Proselytes of righteousness**. See *proselyte*.—**The righteousness of God** (Rom. i. 17), a phrase defined antagonistically by Biblical interpreters as "Righteousness which proceeds from God, the relation of being right into which man is put by God—that is, by an act of God declaring him righteous" (*Meyer*), and as "The attribute of God, embodied in Christ, manifested in the world, revealed in the Gospel, communicated to the individual soul, the righteousness not of the law, but of faith" (*Jowett*). The former is the general Protestant view; the latter comes near the view of the Roman Catholic Church, Greek Church, etc. The one regards *righteousness* as indicating a relation, the other as descriptive of character; the one as something bestowed by God and imputed to man, the other as something inherent in God and spiritually communicated to man.—**Syn.** 1. See *righteous*.

The rotation of the plane of polarization by certain substances showing circular polarization is called *right-handed* when, to an observer looking in the direction in which the ray is moving, the rotation is clockwise—that is, in the same direction as that of the hands of a clock; if in the opposite direction (counter-clockwise), the rotation is called *left-handed*. The quality of being rigid; stiffness; inflexibility; absence of pliancy; specifically, in *mech.*, resistance to change of form. In all theoretical discussions respecting the application of forces through the intervention of machines, those machines are assumed to be perfectly rigid so far as the forces employed are able to affect their integrity of form and structure. *Rigidity* is directly opposed to *flexibility*, and only indirectly to *malleability* and *ductility*, which depend chiefly on relations between the tenacity, the rigidity, and the limit of elasticity.

rime¹ (rim), *n.* [Also and more commonly *rhyme*, a spelling first used, alternating with *rhime*, about the year 1550, and due to the erroneous notion that the word is identical with *rhythm* (indeed even the spellings *rhythm* and *rhithm* were sometimes used for the proper word *rime*); prop. only *rime*, a spelling which has never become wholly obsolete and is now widely used by persons who are aware of the blunder involved in the spelling *rhyme*. Early mod. E. *rime*, *ryme*, < ME. *rime*, *ryme*, *rim*, *rym*, number, rime, verse, < AS. *rim*, number (not in the senses 'verse' or 'rime,' which appear to be of Rom. origin), = OS. **rim*, number (in comp. *un-rim* = AS. *unrim*, "numbers without number," a great number), = OFries. *rim*, tale, = MD. *rijm*, *rijme*, D. *rijm* = MLG. *rim*, LG. *riem*, *rim*, rime, = OHG. *rim*, erroneously *hrim*, number, series, row, MHG. *rim*, verse, rime, G. *reim*, rime, = Icel. *rim*, also *rima* = Sw. The sense of 'poetic number,' whence 'verse,' 'a tale in verse,' 'agreement of terminal sounds,' seems to have arisen in Rom., this meaning, with the thing itself, being unknown to the earlier Teut. tongues.

The transition of sense, though paralleled by a similar development of *number* and *tale*, was prob. due in part to association with L. *rhythmus*, ML. also *rhithmus*, *rhithmus*, *ritmus*, which, with the Rom. forms, and later the E. form *rhythm*, seems to have been constantly confused with *rime*, the two words having the sense 'verse' in common. Connection of AS. *rim*, etc., with Gr. *ῥυθμός*, number (see *arithmetic*), Ir. Gael. *aireamh*, number, = W. *eirif*, number, Ir. *rimh* = W. *rhif*, number, is improbable.] 1. Number.

When only the consonants are alike, it is called *half rime*.

In western Europe the disease has prevailed from time to time since the fourth century in extensive epizootics. From its home on the steppes of eastern Russia and central Asia it has been carried westward by the great migrations and later by the transportation of cattle. The losses in Europe have been enormous. Thus, in 1711–14 1,500,000 beeves are said to have perished, and in 1870–1 30,000 beeves in France alone. The infection (the precise nature of which has not yet been definitely determined) may be transmitted directly by sick animals or indirectly by manure, or by persons and animals going from the sick to the well. It may be carried a short distance in the air. Its vitality is retained longest in the moist condition. The disease, after a period of incubation of from three to six days, begins with high temperature, rapid pulse, and cessation of milk secretion. This latent period is followed by a congestion of all the visible mucous membranes, on which small erosions or ulcers subsequently develop. About 90 per cent. of all attacked die in from four to seven days after the appearance of the disease. If the animal survives, one attack confers a lasting immunity.

A [political] Ring is, in its common form, a small number of persons who get possession of an administrative machine, and distribute the offices or other good things connected with it among a band of fellows, of greater or less dimensions, who agree to divide with them whatever they make. *The Nation*, XIII. 333.

Those who in great cities form the committees and work the machine are persons whose chief aim in life is to make their living by office. . . . Such a combination is called a Ring. *Bryce*, *Amer. Commonwealth*, II. 75.

See *abdominal*.—Annual ring, in bot., one of the concentric layers of wood produced yearly in exogenous trunks. Such rings result from the more porous structure of the wood formed in spring as compared with the autumn growth, a difference attributed to less and greater tension of the bark at the two seasons. In the exogens of temperate regions, on account of the winter rest, these zones are strongly marked; in those of the tropics they are less obvious, but the same difference of structure exists in them with few if any exceptions, save in cases of individual peculiarity. In temperate climates a double ring is exceptionally produced in one season, owing to a cessation and resumption of growth, caused, for example, by the stripping of the leaves. It is a question whether some, especially tropical, trees do not normally form semiannual rings corresponding to two growing seasons. Somewhat similar rings are formed, several in a season, in such roots as the beet. These have no reference to seasons, but result, according to De Bary, from the successive formation of cambium-zones in the peripheral layer of parenchyma. See *mantle*.—**Tracheal rings**, in *anat.* and *zool.*, the rings or hoops of cartilage (sometimes of bone) which are situated in the walls of the windpipe and serve to keep that air-passage permanently distended. Such rings are usually of hyaline cartilage and very elastic, but may ossify more or less completely. They are numerous, closely succeeding one another along the course of the trachea. They are frequently incomplete in a part of their circumference, or otherwise irregular, when, like the corresponding bronchial rings, they are known as *half-rings*. In animals whose necks undergo notable lengthening and shortening in different attitudes of the head, the rings provide for a corresponding extension and contraction of the trachea, as notably in birds, whose tracheal rings are regularly beveled alternately on the right and left sides, so as to slide over one another when the windpipe is contracted in retraction of the neck. (See cut under *tracheal*.) Tracheal rings are normally much alike in most of the length of the windpipe, but commonly undergo special modifications at each end of that tube (see *cricoid*, n., and cut under *pes-nukus*); less frequently several rings are enlarged and con-

solidated in a dilatation called the *tympaum*. Several ordinary rings are shown in the cuts under *larynx* and *mouth*.—**Tweed Ring**, an association of corrupt politicians belonging to the Tammany Society, which from about 1863 to 1871 controlled nearly all the departments of administration in New York city, and plundered the city of many millions of dollars. river² (riv'ēr), n. [< ME. *river*, *rivere* (= D.

a river, stream, = Pr. *ribiera*, *ribayra*, shore,

ria*, a sea-shore or river-bank, a river, fem. of
L. *riparius*, of or belonging to a bank, < *ripa*,
a bank of a stream (rarely the coast of the sea):
see *rive³*. The word *river* is not connected
with the word *rivulet*.] 1. A considerable body
of water flowing with a perceptible current
in a certain definite course or channel, and usu-
ally without cessation during the entire year.

Some watercourses, however, are called *river*s although
their beds may be almost, or even entirely, dry during
more or less of the year. As water must find its way
downward, under the influence of gravity, wherever the
opportunity is offered, most rivers reach the ocean, which
is the lowest attainable level, either independently or by
uniting with some other stream; but this process of join-
ing and becoming merged in another river may be re-
peated several times before the main stream is finally
reached. As a general rule, the river which heads furthest
from the sea, or which has the longest course, retains its
name, while the affluents entering it lose their identity
when merged in the larger stream. There are various ex-
ceptions to this, one of the most remarkable of which is
the Mississippi, which retains that name to its mouth,
although the affluent called the Missouri is much longer
than the Mississippi and somewhat larger at the junction.

Asia, North America, and South America have "closed
basins," or regions in which the surplus water does not find
its way to the sea, for the reason that there evaporation is
in excess of precipitation, so that the water cannot accu-
mulate to a height sufficient to allow it to run over at the
lowest point in the edge of the basin, and thus reach the
sea. The water carried by rivers is rain or melted snow,
a part of which runs on the surface to the nearest rivulet
while the rain is falling, or immediately after it has fallen,
while a larger part consists of that rain-water which, fall-
ing upon a permeable material, such as sand and gravel,
sinks beneath the surface for a certain distance, and then
makes its way to the nearest available river, more or less
slowly according to the permeability of the superficial
material, the extent to which it is saturated with water,
and the nature and position of the impermeable beds, as
of clay or crystalline rocks, which may underlie it. Were
the surface everywhere entirely impermeable, the rainfall
would be carried at once to the nearest rivers, and disas-
trous freshets would be the rule rather than the exception
in regions of large rainfall. It is a matter of great im-
portance that many of the largest rivers head in high
mountain regions, where the precipitation is chiefly or
entirely in the form of snow, which can melt only gradu-
ally, so that disastrous floods are thus prevented, while
the winter's precipitation in many regions is stored away
for summer's use, extensive tracts being thus made avail-
able for habitation which otherwise would be deserts.

The size of a river depends chiefly on the orographical
features and the amount of rainfall of the region through
which it flows. Thus, the Amazon is the largest river in
the world because the peculiar topography of South
America causes the drainage of a vast region (over a mil-
lion and a half square miles) to converge toward one cen-
tral line, and because throughout the whole course of that
river and its branches there is a region of very large rain-
fall. The Orinoco, although draining an area less than

one fifth of that of the Amazon, is navigable for fully 1,000
miles, and is, when full, over three miles wide at 560 miles
from its mouth, because it drains a region of extraordi-
narily large precipitation. The Missouri-Mississippi, on the
other hand, although draining an area nearly as large as
that of the Amazon, is very much inferior to that river in
volume at its mouth, because it flows for a considerable
part of its course through a region where the precipitation
is very small, while it is not extraordinarily large in any
part of the Mississippi basin. The area drained by any
river is called its *basin*; but this term is not generally
used except with reference to a river of considerable size,
and then includes the main river and all its affluents.
The edge of a river-basin is the watershed, in the United
States frequently called the *divide*, and this may be a
mountain-range or an entirely inconspicuous elevation of
the surface. Thus, for a part of the distance, the divide
between the Mississippi basin and that of the Great Lakes
is quite imperceptible topographically. Exceptionally
some large rivers (as the Amazon and Orinoco) inoscu-
late with each other.

The *river* Rhine, it is well known,
Doth wash your city of Cologne.
Coleridge, Cologne.

In speaking of *river*s, Americans commonly put the
name before the word *river*, thus: Connecticut *river*,
Charles *river*, Merrimack *river*; whereas the English would
place the name after it, and say, the *river* Charles, &c.
And when English writers copy from our geographers,
they commonly make this alteration, as will be seen by
referring to any of the English Gazetteers.

Pickering, Vocab.

rivet (riv'et), *n.* [Early mod. E. also *ryret*, *revet*; < OF. *rivet*, *rievet*, a rivet, also the welt of a shoe, < *river*, clench, rivet, tuck in (bedclothes), F. *river*, clench, rivet; cf. Sc. dial. *riv*, clench (Aberdeen), sew coarsely (Shetland), < Icel. *rifa*, tack together, stitch together (Skeat). Cf. *rivet*, *v.*] A short metallic malleable pin or bolt passing through a hole and so fastened as to keep pieces of metal (or sometimes other substances) together; especially, a short bolt or pin of wrought-iron, copper, or of any other malleable material, formed with a head and inserted into a hole at the junction of two or more pieces of metal, the point after insertion being hammered broad so as to keep the pieces closely bound together. Large rivets are usually hammered or closed up (riveted) when they are in a heated state, so as to draw the pieces more firmly together by the contraction of the rivet when cool. It is in this manner that boilers, tanks, etc., are made. Small rivets are frequently riveted cold. Instead of being closed by hammering, rivets are now often riveted by means of powerful machinery, which makes better joints than can be made by hand, and executes the work far more quickly. In some kinds of metal-work, as armor, the metal pin is movable in a slot, allowing one of the plates of metal to slide over the other for a certain distance. Compare *Almain-rivet*.

The armourers, accomplishing the knights,
With busy hammers closing rivets up,
Give dreadful note of preparation.
Shak., I. Hen. V., iv. (cho.).

To fasten with a rivet or with rivets: as, to *rivet* two pieces of iron.

2. To clench: as, to *rivet* a pin or bolt.—3. Figuratively, to fasten firmly; make firm, strong, or immovable: as, to *rivet* friendship.

riveting-machine (riv'et-ing-ma-shén'), *n.* A power-machine for forcing hot rivets into position in metal-work and heading them. Such machines consist essentially of a die and anvil: and in typical forms of the machine the work to be riveted is supported over the anvil, the hot rivet is put in the hole, its end resting in a die-socket in the anvil, and the horizontal die advances, squeezes the rivet into place, and shapes both heads at the same time. Riveting-machines are made in a great variety of forms for both light and heavy work. In some the anvil and die are both movable and are operated by hydraulic power. Some recent machines are portable, and are suspended by chains from a crane, so that the machine can be brought to the work instead of carrying the work to the machine. A recent American machine employs an anvil and a riveting-hammer operated by compressed air and delivering a series of rapid blows instead of a direct pressure, and thus more nearly copies hand-work. Riveting-machines are sometimes called by special names, as the *girder riveter*, *keel riveter*, etc.

It is characterized by a globose and compressed fleshy fruit, and by flowers with a calyx of four small equal segments, four stamens, a short curved style, and capitate stigma. The five enumerated species are reducible perhaps to one, *R. laevis*, a native of tropical and subtropical America, extending into Texas and Florida, introduced in Asia and some African islands. It is an erect smooth or hairy herb with shrubby base, 6 or 8 feet high, or in some forms much smaller, producing many two-forked and two-furrowed branches. It bears alternate slender-petioled thin ovate leaves, and slender pendulous racemes of small reddish-white flowers, followed by red pea-like berries. In the West Indies it is called *hoop-withe*. The smaller variety, *humilis*, is known as *blood-berry*, also as *rouge-berry* or *rouge-plant*, from a use made of its fruit before it becomes dry. Both plants, especially the latter, are somewhat cultivated for ornament.

Agardh, 1825), < *Rivina* + *-ae*.] A tribe of plants of the order *Phytolaccaceae*, characterized by a four- or five-parted calyx, a one-celled ovary, and an indehiscent dry or fleshy fruit, containing a single seed with two plicate-convolute seed-leaves. (Roth, 1797), < L. *rivulus*, a small stream: see *rivulet*.] A genus of mostly fresh-water algae of the class *Cyanophyceae* and type of the order *Rivulariaceae*. The filaments are radiately arranged, agglutinated by a more or less firm mucilage, and unitedly forming hemispherical or bladder-like well-defined forms; the heterocysts are basal. They occur in both running and standing fresh water—*R. fastida*, for example, forming a blue-green scum on stagnant pools; and there are a few species in brackish or salt water.

Rivulariaceae (riv-ü-lä-ri-ä'sê-ê), *n. pl.* [NL., < *Rivularia* + *-aceae*.] An order of usually minute algae of the class *Cyanophyceae*, typified by the genus *Rivularia*. 1. To cook, dress, or prepare (meats) for eating, originally on a grate or gridiron over or beneath a fire (broiling), but now by exposure to the direct action of dry heat (roasting). Roasting is generally performed by revolving the article on a spit or a string before a fire, with a reflector or Dutch oven to concentrate the heat: in primitive cookery hot ashes serve a similar purpose. Meat cooked over or beneath a fire, on a gridiron, is now said to be *broiled*; and meat cooked in a stove- or range-oven, where it does not receive the direct action of the fire, is properly said to be *baked* (though generally said to be *roasted*).

The objects of roasting substances are various: (*a*) to expel from them something which can be separated by heat alone, as when calamin (carbonate of zinc) is roasted in order to expel the carbonic acid; (*b*) to expel some ingredient capable of being got rid of by the agency of heat and air, oxygen being substituted for the material thus expelled, as when sulphuret of lead is roasted to expel the sulphur; (*c*) to raise to a higher stage of oxidation, as when tap-cinder (silicate of the protoxide of iron) is roasted in order to convert it into a silicate of the peroxide. See *calcination*.

robin (rob'in), *n.* [Short for *robin-redbreast*, early mod. E. *robyn redbreast*, < ME. **robin redbreast*, *robinet redbreast*, in which the first element was orig. a quasi-proper name, *Robin*, < OF. *Robin*, *Robin* (a name also given to the sheep), a familiar dim. of *Robert*, *Robert* (a name early known in England, as that of the oldest son of William I.), = Sp. A small sylvine bird of Europe, *Erythacus rubecula*, more fully called *robin-redbreast*, and also *redbreast*, *robinet*, and *ruddock*. It is more like a warbler than like a thrush, only about 5½ inches long and 9 in extent of wings; the upper parts are olive-green; the forehead, sides of the head, front of the neck, and fore part of the breast are yellowish-red (whence the name *redbreast*). It is an abundant and familiar British bird, widely distributed in other parts of the Palearctic region. The song is rich, mellow, and finely modulated. The nest is placed on the ground, in herbage or moss, generally under a hedge or bush. The eggs are usually five or six in number, pinkish-white freckled with purplish-red. This robin is a common figure in English nursery tales and folk-lore.

The pious bird with the scarlet breast,

2. The red-breasted or migratory thrush of North America, *Turdus migratorius* or *Merula migratoria*, one of the most abundant and fa-

American Robin (*Merula migratoria*).

miliar of North American birds: so called from the reddish-brown color of the under parts, which, however, is very different, both in hue and in extent, from that of the European red-breast. This robin is 10 inches long and 16 in extent of wings. The upper parts are slate-color with an olive shade; most of the under parts are chestnut-red; the vent-feathers are white, with dusky markings; the head is black, with white marks about the eyes and white streaks on the throat; and the tail is blackish, usually marked with white at the ends of the outer feathers. The bill is mostly yellow. The robin inhabits the whole of North America; it is migratory, feeds on insects, worms, berries, and other fruits, and breeds at large throughout its range, building a large strong nest of hay and mud on a bough, and laying from four to six uniform greenish-blue eggs, 1½ inches long by 1 inch broad. Also, familiarly, *robin-redbreast*.

3. With a qualifying term, one of numerous warbler-like or thrush-like birds, more or less nearly related to or resembling either of the foregoing: as, the blue-throated robin. (See *Cyanocitta*, and cut under *bluethroat*.) Some of these terms are book-names, others are casual transfers of the word *robin* by English residents in various parts of the world, especially India and Australia. In the latter region are various flycatchers (*Muscicapidae*) of the genus *Petroica* and its subdivisions, some of which are called robins, as the scarlet-breasted, *P. multicolor*, peculiar to Norfolk Island. Some of the Asiatic chats of the genus *Pratincola* are known as *Indian robins*; these are related to the British whinchat and stonechat, and do not particularly resemble the true robin of England. Others, recently separated generally under the name *Erythronias*, inhabit Java, Sumatra, Borneo, and other islands of the same zoogeographical region, and resemble the true robin, as *E. dumetoria* and *E. muelleri*. The red-breasted flycatcher, *Muscicapa (Erythronias) parva*, which ranges from central Europe into India, bears a striking resemblance to the true robin. Among other Indian robins, loosely so called, may be noted one sometimes specified as the *water-robin*. This is a flycatcher, *Xanthopygia fuliginosa*, originally described by Vigors in 1831 as *Phoeniceura fuliginosa*, and commonly catalogued as *Ruticilla fuliginosa* (after G. R. Gray); but it does not belong to the same family as the robin, nor to the same genus as the redstart. It inhabits the Himalayan region, and ranges widely in China and India. It has been placed in 5 different genera, two of which, *Rhyacornis* of Blanford and *Nymphæus* of A. O. Hume, were specially framed for its reception.

By derivation it means having the power of exerting great muscular force. *Robust* suggests an oaken strength, hence compactness, toughness, soundness of constitution, blooming health, and good size if not largeness of frame. *Lusty* characterizes the kind of strength that one enjoys possessing, abounding health, strength, vitality, and spirits. *Sturdy* suggests compactness and solidity even more than *robust* does; it expresses a well-knit strength that is hard to shake or resist, standing strongly upon its feet. *Stalwart* suggests tallness or largeness with great strength or sturdiness. *Stout* is little different from *strong*; it sometimes means strong to do or to support burdens: as, a *stout* defender; a *stout* porter carrying a heavy trunk.

Cf. *rock*².] A fabulous bird of prey of monstrous size, famous in Arabian mythology, and corresponding to the Persian simurg. There is no certain basis of fact upon which the myth of the roc rests. The most colossal birds of which we have any knowledge are the dinosaurian moas of New Zealand and the Madagascar pygmy-like elephant-birds. The largest known rapacious bird (the roc figures as a bird of prey) is the *Harpagornis*, which may have been able to kill a moa, though certainly not to fly away with one. The most plausible speculation bases the roc on the *Epyornis*. See the quotation.

On the 27th of January, 1851, Isidore Geoffroy Saint-Hilaire read before the Parisian Academy of Sciences a paper, in which he described two enormous eggs and part of the metatarsus of a bird which he called *Epyornis*

maximus. . . This brought again to mind the old story of the famous Venetian traveller, Marco Polo, who located the *roc* or *roc*, the giant bird of the Arabian tales, upon Madagascar, and related that the great Khan of the Tartars, having heard of the bird, sent messengers to Madagascar, who brought back a feather nine spans long, and two palms in circumference. *Stand. The thallus is fruticose or finally pendulous, alike on both sides, and cartilaginous-coriaceous; the medullary layer is loosely cottony. The species are few and closely related, growing especially in the warmer maritime regions of the earth, and furnishing the famous archil or orchil of dyers. *R. tinctoria* and *R. fuciformis*, the best-known species, are the chief sources of the dye. See cut under *archil*; see also *canary moss*, *cape-weed*, *dyer's moss*, *flat-orchil*, *lignum*, *Mauritius-weed*.

It is characterized by a salver-shaped corolla with its tube much longer than the small five cleft calyx, the five stamens united to the petals, and five free carpels, attenuated into elongated and exerted converging styles. The 4 species are natives of South Africa, and are fleshy undershrubs, bearing thick opposite leaves with united bases. The flowers are showy and rather large, white, yellow, scarlet, or rose-colored, and clustered in dense cymes. For these and the singular leaves the species are somewhat cultivated as house-plants. *R. coccinea*, with scarlet flowers, has the name of *coral*, and *R. falcata* is sometimes called *ice-plant*.

MS. Bibl. Reg., 12 B. i. f. 12. (Halliwell.)

2. *Eccles.*, a close-fitting vestment of linen or lawn, worn by bishops and some others. It reaches to the knees or lower, and has close sleeves extending to the wrists, or is sleeveless. The rochet is a variety of the alb or surplice, the latter differing from both alb and rochet by the fullness of its sleeves. In the Roman Catholic Church the rochet is worn by bishops and abbots, usually under a manteletta, and, as a choir vestment, by some canons. In the Anglican Church the rochet is worn under the chimere—these vestments constituting the distinctive episcopal habit as ordinarily worn in church and in Parliament and Convocation. The lawn sleeves are now made very full, and attached to the chimere, not to the rochet.

rock¹ (rok), *n.* [*< ME. rocce*, *rokke*, < AS. **rocc* (in *stān-rocc*, 'stone-rock') = OF. *roc*, m. (= *It. rocco*, m.), *roke*, usually assimilated *roche* (> ME. *roche*, E. obs. *roch*², q. v.), F. *roche*, f., = Pr. *roca*, *rocha* = Sp. *roca* = Pg. *roca*, *rocha* = *It. rocca*, *roccia*, < ML. *roca*, *rocca*, a rock; prob. of Celtic origin: Ir. Gael. *roc* = Bret. *roch*, a rock. According to Diez, prob. < LL. **rupica*, or *rupea*, < *L. rupes*, a rock.] 1. The mass of mineral matter of which the earth, so far as accessible to observation, is made up; a mass, fragment, or piece of that crust, if too large to be designated as a *stone*, and if spoken of in a general way without special designation of its nature. When there is such special designation, the term *stone* is more generally adopted, as in *building-stone*, *paring-stone*, *limestone*, *freestone*; or the special designation of the material itself may be used without qualification, as *granite*, *slate*, *marble*, etc. The unconsolidated stony materials which form a considerable part of the superficial crust, or that which is at or near the surface, such as sand, gravel, and clay, are not commonly designated as *rock* or *rocks*; the geologist, however, includes under the term *rock* for the purpose of general description, all the consolidated materials forming the crust, as well as the fragmental or detrital beds which have been derived from it. Rocks are ordinarily composed of two or more mineral species, but some rocks are made up almost entirely of one species: thus, granite is essentially an aggregate of quartz, feldspar, and mica, while marble usually consists chiefly of carbonate of lime, and sandstone and quartzite chiefly of quartz. The number of varieties of rock, according to the classification and description of lithologists, is very great. The number of names popularly in use for rocks is small: *granite*, *porphyry*, *lava*, *sandstone* or *freestone*, *limestone*, *marble*, and *slate* are terms under one or the other of which by far the largest part of the rocks are commonly classed. (See these words.) More than 400 distinct species of minerals have been described, but a very small number of them occur as essential constituents of rocks: of these, quartz, the feldspars, the micas, the minerals of the augite and hornblende group, talc, chlorite, olivin, and carbonate of lime, with which often more or less of carbonate of magnesia is associated, form the great bulk of the rocks. But there are several other minerals which are quite commonly found as accessory constituents, and sometimes in masses large enough to be worthy of the designation of *rock*: such are garnet, epidote, various oxides of iron, pyrites, apatite, andalusite, leucite, tourmalin, and a few others. Some mineral substances occur in masses of great extent and thickness, but do not play the part of rock-forming minerals: such are salt, gypsum, and the varieties of coal. Rocks are variously classed by geologists. The most general subdivision of them is into *igneous* and *aqueous*: the former are divided into *plutonic* and *volcanic*, according as they have been formed under conditions of depth and pressure, like granite, or have been poured out upon the surface in the manner of lava. The aqueous rocks are also designated as *sedimentary*, *fossiliferous*, or *stratified*. The sedimentary rocks in general are believed to be made up of material resulting from the decay and abrasion of igneous masses, since almost all geologists admit that the crust of the earth has cooled from a state of fusion. Part of the stratified deposits, however,

have been formed through the agency of life, as in the case of the limestones, most of which have been secreted from an aqueous solution by various organisms. and of coal, which is the result of a peculiar kind of decay of vegetable matter. Some rocks have been formed by the simple evaporation of a solution: for instance, rock-salt. The sedimentary rocks are classified for lithological description according to the nature and texture of the materials of which they are made up: they are arranged in the chronological order of their deposition according to the nature of the fossils which they contain. Sedimentary rocks have frequently been greatly changed in character by metamorphosis, by which they have been rendered crystalline, and sometimes made so closely to resemble igneous rocks that their true character can only with the greatest difficulty be made out.

When ye han maad the coost so clene
Of rokkes that ther nys no stoorn ysene.

A rock may be defined as a mass of mineral matter, composed of one, more usually of several, kinds of minerals, having, as a rule, no definite external form, and liable to vary considerably in chemical composition.

Tennyson, In Memoriam, Conclusion.

Rocking bob. Same as *balance-bob*.—**Rocking stone,** a large block of stone poised so nicely upon its point that a moderate force applied to it causes it to rock or oscillate. Such stones are most common in regions of granite, and especially where it has a marked cuboidal jointing. The quadrangular masses resulting from the weathering of this granite assume spherical forms, since the edges and angles waste away more rapidly than the sides, and a rocking stone is not infrequently the result. There are several rocking stones in the granite region of Devonshire and Cornwall, where they are known as *loggans*, *loggan-stones*, or *loggan-rocks*. The best-known of these is near Castle Treyn, St. Levan; it is about 17 feet long, and weighs about 65 tons. "There are seven loggan-rocks in the parish of Zennor." Woodward, Geol. of Eng. and Wales (2d ed.), p. 606.

The same cause affects granitic cliffs, rounding the surfaces formed by the "joints," and often leaving detached blocks on the brow of the cliff; and they also give rise to the *Rocking Stones* common in granite districts.

Prentice, Geol., I. 56.

=*Syn.* 1 and 2. *Rock, Shake, Swing, Roll.* *Shake* expresses a quicker, more sudden, and less uniform motion than the others: as, to *shake* a tree or a carpet; his knees *shake*. *Rock* expresses the slow and regular motion to and fro of a body supported below—as a cradle upon *rockers*, or a rocking stone—or at the sides. *Swing* expresses the regular and generally slow motion to and fro, or around and around, of a body supported or held at one end, generally above: as, the *swinging* of a pendulum, a censer, a sword. *Roll* is sometimes used of an irregular motion to and fro, suggesting the *rolling* over of a round log; as, a *rolling* walk; the *rolling* of a ship in the trough of the sea. The figurative uses of these words are akin to their literal meanings: a ship *rocks* when the wind is steady on the aft quarter: it *swings* about its anchor with the change of the tide; it *shakes* with each blow from a heavy wave.

On the Scilly Islands such cavities are common: some are called *devils kettles* and *devils punch-bowls*, and one group is known as the *Kettle and Pans*. A cylindrical tube of pasteboard or metal filled with a mixture of niter, sulphur, charcoal, etc., which, on being ignited at the base, propels the tube forward by the impact of the liberated gases against the atmosphere. Rockets are used for various purposes. (a) In war, when the apparatus generally consists of a sheet-iron case filled with a composition such as is described above, and a head which may be solid, or hollow and filled with a bursting-charge. (b) Life-rockets, used for carrying a line over a wreck, and thus establishing communication between the ship and the shore. The Russian rocket has a short stick attached to the base and armed with a hook which slides in a groove on the under side of the rocket-stand and engages the ring of the chain attached to the line as the rocket leaves the stand. The German system comprises five-centimeter and eight-centimeter rockets and eight-centimeter anchor-rockets, all of which have long chains attached to the rocket-stick at one end and to the line at the other. The English system consists of double Boxer rockets placed end to end in a single metallic case, having a stick fastened to one side of the case. The Hooper rocket is a modification of the Hale war-rocket, and was very unsatisfactory in its results. All these rockets have metallic cases, and are fired by means of fuses. The uncertainty of their flight and their liability to deterioration by transportation and storage have prevented their adoption for life-saving purposes in the United States. the same composition, but with a conical head containing stars of various ingredients and colors, and a quantity of powder which, when the rocket has attained its greatest height, bursts the cylinder, when the ignited stars spread through the air and cast a brilliant or colored light producing a beautiful effect. These rockets are used in signaling or for mere pyrotechnic display. Rockets are kept point foremost in their flight by means of a stick projecting behind, which acts in the same way as the shaft of an arrow.

To the head of such rockets may be placed petards, balls of fire, grenades, etc., and so may be applied to warlike affairs. *Mathematical Recreations* (1674).

And the final event to himself [Burke] has been that, as he rose like a rocket, he fell like the stick.

T. Paine, Letters to the Addressers. (Bartlett.)

2. The lever by which a forge-bellows is inflated. — **Congreve rocket**, a large rocket having a shell of sheet-iron and carrying charges of canister-shot, bullets, and other missiles. Sir William Congreve, who first introduced this weapon into warfare, and from whom its name is derived, caused sizes to be constructed ranging from 12 to 32 pounds, with sticks for the larger sizes 20 feet in length. The first notable use of Congreve rockets was at Copenhagen in 1807, and among the then-existing means of attack it proved a very formidable weapon. The composition used in these rockets is saltpeter, sulphur, and charcoal; and they sometimes have a metal head loaded with a bursting-charge very destructive in a fortress or town. Modern improvements in ordnance have supplied more efficient means of attack, and rockets are now used in warfare chiefly as a means for signaling.

rockwork which figures in the style), *< roche* (ML. *roca*), a rock: see *rock*¹.] A variety of ornament originating in the Louis-Quatorze style and continuing with constantly increasing inorganic exaggeration and extravagance throughout the artistic degeneracy of the Louis-Quinze. It is generally a meaningless, though often a very rich, assemblage of fantastic scrolls and crimped conventional shell-work, wrought into irregular and indescribable forms, without individuality and without expression apart from its usually costly material and surroundings. The style has a certain interest from its use in a great number of sumptuous European residences, and from its intimate association with a social life of great outward refinement and splendor. Much of the painting, engraving, porcelain-work, etc., of the time has, too, a real decorative charm, though not of a very high order in art. Hence *rococo* is used attributively in contempt to note anything feebly pretentious and tasteless in art or literature. Compare *baroque*.

The jumble called *rococo* is, in general, detestable. A parrot seems to have invented the word; and the thing is worthy of his tawdriness and his incoherence.

(e) A long, light, tapering, elastic pole used in angling, to which the line is attached, now usually made in adjustable sections or joints, and fitted with guides and a reel. There are eight woods commonly used for rods, of which four are solid (greenheart, hickory, ash, and willow) and four are hollow (East Indian bamboo, Carolina and West Indian cane, white cane, and jungle-cane). Rods have also been made of hard rubber and of steel. Jointed rods are made in three or four pieces, of which the largest and heaviest is the butt, and the slenderest is the tip. The joints are fitted with metal rings or ferrules, and with small rings called *guides* to receive the line. The reel is stepped into the butt, near its end, or otherwise suitably attached, as by a reel-plate. The special makes of rods are very numerous, and their names almost equally so. Besides being named and classed according to the material

of which they are composed, as *bamboo rod*, etc., they are commonly identified with the name of the fish for which they are specially designed: as, *salmon-rod*, *trout-rod*, *bas-rod*, etc. All rods are, however, divisible into three classes, according to their make and purpose. These are (1) the *fly-rod*, which is long, slender, tapering, tough, and highly elastic; (2) the *trotting-rod*, which is comparatively short, stout, and stiff; and (3) the *bait-rod*, which is a mean between the other two. Fly-rods are most used, with artificial flies. Split-bamboo rods are now manufactured for all kinds of angling. See *fly-rod*, and cut under *reel*. (f) An instrument for measuring.

2. In *mech.*, any bar slender in proportion to its length, particularly such a bar used as a brace or a tie between parts for connecting them, or for strengthening a connection between them. The term is used in a very indefinite manner, depending entirely upon individual judgment or caprice. What some would call a rod would by others be called a bar.

The *rod* in the shaft, known as the main *rod* or *spear rod*, is usually made of strong balks of timber butted together and connected by strapping plates fastened by bolts. *Encyc. Brit.*, XVI. 458.

3. Specifically, in a steam-engine, the pitman which connects the cross-head with the crank: also and more generally called *connecting-rod*. The connection is made at the cross-head to the cross-head pin, and at the crank to the crank-wrist. See cut under *steam-engine*.—4. A measure of length equal to 5½ yards, or 16½ feet. (Also called *pole* and *perch*.) A square rod is the usual measure of brickwork, and is equal to 272½ square feet.—5. A shoot or branch of a family; a tribe or race.

6. In *anat.*, one of numerous slender rod-like or bacillary structures which collectively form, together with similar but conical bodies called *cones*, one of the layers of which the retina of the eye is composed, called the *layer of rods and cones*, essential to the function of vision. See cut under *retina*.—7. In *entom.*, specifically, any differentiation of the anterior end of a retinal cell of the eye, which may unite to form a rhabdom. See *rhabdomere*.—*Bait-rod*, a fishing-rod used with natural bait.—*Binding-rod*, a tie-rod.—*Boning-rod*. See *boning*.—*Cortian rods*. Same as *rods of Corti*.—*Crystalline rods*. See *crystalline*.—*Divining rod*. See *divining-rod*.—*Lengthening rod*, an extension-rod fitted with screws at the ends and used as a long shank for an auger or a drill in deep boring, as for a tubewell.—*Meckellian rod*, in *embryol.*, the cartilaginous basis of the mandibular or first postoral visceral arch of the embryo of most vertebrates, about the greater distal section of which the ossification of the lower jawbone takes place, the proximal end being converted into the malleus of a mammal, the quadrate bone of a bird or reptile, or the corresponding bones of lower vertebrates. See cut under *palatoplate*. Also called *Meckel's cartilage*.—*Napier's rods* (or *bones*), a contrivance, commonly attributed to John Napier (1550-1617), but in fact described in the Arithmetic of Oronce Finée (1532), for facilitating large calculations in multiplication or division for those who do not perfectly know the multiplication table. It consists of a number of rods made of bone, ivory, horn, wood, pasteboard, or other convenient material, the face of each of which is divided into nine equal parts in the form of little squares, and each part, with the exception of the top compartment, subdivided by a dexter diagonal line into two triangles. These nine little squares contain the successive multiples of the number in the first, the figures in the tens' place being separated by the diagonal line from that in the units' place. A sufficient number of rods must be provided for each of the headings 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, so that by placing the proper rods side by side any number may be seen at the top, while the several multiples occupy, in order, the eight lower compartments; when the multiple consists of two figures these are placed one on each side of the diagonal line. There is also a rod called the *index-rod*, the squares on which are not subdivided into triangles. To multiply, for example, the number 6789 by 56: Place four of the rods together, so that the top numbers form the multiplicand; then look on the index-rod for 6, the first number of the multiplier, and on the corresponding compartments of the four rods the following disposition of figures will be found ranged in the two lines formed by the triangles of each square.

of driving-wheels, a rod connecting the crank-pins of all the driving-wheels on one side of the engine, so that when one is moved by the piston-rod all will be moved equally. Also called *coupling-rod*. — **Pedal rod**. See *pedal*. — **Perforating rods of Sharpey**. Same as *Sharpey's fibers* (which see, under *fiber*). — **Rod-and-cone layer of the retina**. See *retina*. — **Rod license**. See *license*. — **Rods of Corti**, the pillars of the arches of the organ of Corti. The external rods which form the outer pillars are shorter and less numerous than the inner rods. They consist of a cylindrical striated body with an expanded base; the upper extremity is curved, and has somewhat the shape of the head of a bird; the back part fits into a cavity between the heads of two or more inner rods; while the bill-like process projects toward the reticular membrane. The inner rods have a striated body and an expanded base; the heads have a concavity which receives the outer rods, and a process entering into the composition of the membrana reticularis. The arches thus formed support the outer and inner hair-cells. Also called *pillars of Corti*. — **Setting-out rod**, a guide or gage used in making window-frames, doors, etc. — **Split rod**. (a) One of the rods into which plates of wrought-iron are cut by means of slitting rollers, to be afterward made into nails. (b) A fishing-rod made in sections of split bamboo strips. — **To have a rod in pickle for one**. See *pickle*. — **To kiss the rod**. See *kiss*.

The brain has a relatively small cerebrum, leaving much of the cerebellum and olfactory lobes exposed, and the corpus callosum has no well-defined rostrum in front. The placenta is discoidal-deciduate. The limbs are ambulatorial, variously modified for running, leaping, climbing, or swimming. The condyle of the lower jaw has its long axis longitudinal, and is not confined in a special socket, but glides back and forth, so that the lower jaw can be put forward and backward as well as moved up and down. The molar teeth are typically ridged on their crowns in various patterns; they are nearly always 3 in number above and below on each side. The premolars are small or few, often none. There are no canines. The incisors are large, strong, heavily enameled on their front surface, sculpiform or beveled to a sharp edge, and grow continually from persistently open pulps; their roots traverse much or nearly all of the bones of either jaw, in the arc of a circle. The typical number of incisors is 2 above and below, or one

pair of upper and under front teeth; exceptionally, as in the rabbit tribe, there are small supplementary upper incisors, crowded together and concealed behind the functional pair. In some groups, as *Arvicolinae*, the molar teeth are perennial, like the incisors. There being no canines, and the premolars being few and small, if any, there is a great gap between the front and the back teeth. The typical number of teeth is 16, which obtains with few exceptions throughout the murine series of rodents; in one genus there are only 12. In the hystricine series there are normally 20 teeth, in one genus 16. In the sciurine series the teeth are always either 20 or 22; in the leporine series there are 26 or 28. This order is by far the largest one among mammals, and of world-wide distribution; its numerous members are adapted to every kind of life. They are mostly of small size, a rabbit being far above the average; the beaver, porcupine, or coypou is a very large rodent, and the capibara is a giant. The order is divisible into 3 suborders: (1) *Hebetidentata*, enomol or blunt-toothed rodents, exceptional in having 4 lower incisors, and extinct; (2) *Duplicidentata*, subnormal or double-toothed rodents, with 4 upper incisors; these are the hares, rabbits, and pikas; and (3) *Simplicidentata*, normal or simple-toothed rodents, with only 2 incisors above and below. The last fall in 3 series: (1) *Hystricomorpha*, the hystricine series, including the porcupines and very numerous related forms, chiefly South American, as the capibara, coypou, cavies, viscachas, chinchillas, octodonts, etc. (see cuts under *capibara*, *coypou*, *rabbit-squirrel*, *porcupine*, and *Plagiodon*); (2) *Myomorpha*, the murine series, including rats and mice of all kinds (see cuts under *mouse*, *Muridae*, and *rice-field*); and (3) *Sciuromorpha*, the sciurine series, or the squirrels, spermophiles, marmots, beaver, etc. (see cuts under *Arctomys*, *beaver*, and *prairie-dog*). In addition, the duplicident rodents are (4) *Leporomorpha*, the leporine series, the same as the suborder *Duplicidentata*. (See cut under *Lagomys*.) Many fossils of all these groups are known. There are 20 or 21 families of living rodents, and 100 genera. The order corresponds to the Linnean *Glires*, and is still often called by that name. Also called *Rosores*. See cuts under *castor*, *Leporidae*, and *sculpiform*.

roller (rō'lër), n. [Early mod. E. also *rowler*; *<roll + -er>*.] 1. One who or that which rolls, especially a cylinder which turns on its axis, used for various purposes, as smoothing, crushing, and spreading out. (a) A heavy cylinder of wood, stone, or (now more usually) metal set in a frame, used in agriculture, gardening, road-making, etc., to break lumps of earth, press the ground compactly about newly sown seeds, compress and smooth the surface of grass-fields, level the surface of walks or roads, etc. Land-rollers are also constructed of a series of disks or a series of rings with serrated edges placed side by side. Such rollers are used for breaking up clods and cutting up rough grass-land, and are known as *disk-rollers* and *clod-crushers*. Heavy road-rollers are often combined with steam traction-engines. Agricultural rollers are also combined with other tools, as with a seeder or a harrow. See *roll*, n., 2.

(d) In *etching*, a cylinder, about three inches in diameter, covered with soft leather, and used for revarnishing an imperfectly bitten plate. The ground is applied to the roller with a palette-knife on which a little has been taken up. When the ground has, by repeated passing, been evenly spread over all parts of the roller, this is carefully passed with slight pressure over the etched plate so as to cover its surface with varnish, without allowing it to enter the furrows. (e) In *organ-building*, a wooden bar with pins in the ends upon which it may be rolled or rocked, and two projecting arms, usually at some distance from each other, one of which is pulled by a tracker from the keyboards, while the other pulls a tracker attached to a valve. Rollers are primarily designed to transfer motion from side to side, but they also often change it from a horizontal to a vertical plane, or vice versa. The rollers belonging to a single keyboard are usually placed together on a common roller-board, and the entire mechanism is called a *roller-board action* or *movement*. See cut under *organ*. (f) Any cylindrical tool or part of a machine serving to press, flatten, guide, etc., as the cylinders of a paper-making machine, the impression-cylinders in calico-printing, the roller-die by means of which patterns are transferred to such cylinders, etc. (g) The barrel of a musical box or of a chime-ringing machine.

The resulting surf is so dangerous to shipping that single and double roller-flags are displayed to warn small craft against making for land while the rollers prevail.

rolling-mill (rô'ling-mil), *n.* 1. A metal-working establishment using, in connection with heating-furnaces, systems of steel rollers for forming metal into sheets, bars, rods, or wires. Such rolling-mills sometimes bear special names, as a rail-mill, wire-rolling mill, etc. The essential feature of a rolling-mill is a set or train of steel rollers placed either in pairs one over the other, as in a two-high train, or in a group of three, as in a three-high train. The heated metal direct from the furnaces is presented to these rollers and is drawn through between the trains. It is at once caught on the other side and repassed between the rollers, each passage between them being called a *pass*. In a two-high train the rollers are stopped and reversed at each pass. In a three-high train the rollers turn constantly in one direction, the return pass being between a different pair of rollers from the pair first passed through, the mid-

dle roller, however, always being one of either pair. The distance between the rollers is regulated by screws at the ends. The section given to the metal in passing through the rollers is determined by the shape of the rollers, whether flat or grooved, it being possible to produce in this way bars having a great variety of sections, adapted for independent or structural uses. The rolling mill serves also to some extent to clear the metal passed through it from impurities. Small rolling-mills with tapering rollers are used to roll short flat metal bars into rings, the passage between the rollers expanding the outside more than the inside edge, and thus causing the strip to assume a curved form. See cut under *roll*, 2 (a).

4. [*l. c.* or *cap.*] Noting a form of letter or type of which the text of this book is an example. It is the form preferred for books and newspapers by the Latin races and by English-speaking peoples. Three series are used conjointly in printing: (1) capitals, which are copies of Old Latin lapidary letters; (2) small capitals, a medieval Italian fashion, first made in type by Aldus Manutius in 1501; and (3) minuscule or lower-case letters, first made in type by Sweinhelm and Fannartz at Subiaco in 1465; and afterward, of better form, by Jenson at Venice in 1471.—**Holy Roman Empire**. See *empire*.—**Roman alum**. See *alum*.—**Roman architecture**, the architecture of the ancient Romans, characterized by admirable development and application of the round arch and vault, and of stone and particularly brick masonry of all varieties, especially in small materials and with proper use of excellent cements and mortar, and by adoption of the Greek orders in general as mere exterior ornaments in lavishness of redundant and artificial decoration, and without under-

standing of their delicately studied proportions and logical arrangement. The true Roman architecture, considered apart from its Hellenistic decoration, was not artistic, though the boldness and great span of its arches and vaults very frequently produce a grand and majestic effect; it was, however, a thoroughly practical architecture, flexible to all requirements, and admitting of the quick and solid construction, by great numbers of soldiers or other unskilled workmen, of even the greatest struc-

tures, as aqueducts, bridges, amphitheatres, basilicas, thermae, and fortresses, under the direction of a small number of trained engineers. From the Roman arched and vaulted construction medieval architecture was developed, and back to it can be traced most that is best in modern masonry. The interior decoration of Roman architecture under the empire was evolved from Greek models, without the Greek moderation and refinement; mosaic and molded stucco were profusely used, and wall-painting on a surface of mortar was universal. The artisans of this decoration were in large measure of Greek birth. See cuts under *amphitheater*, *Colosseum*, *octastyle*, *Pantheon*.—**Roman art**, the art of ancient Rome. Under the republic there was practically no Roman art. During the last two centuries of the republic the spoils of Greece, the masterpieces of the Greek sculptor and painter, accumulated in Rome. Greek art became fashionable, and Greek artists began to flock to Rome. The Greek taste became modified to accord with the love of the Romans for lavish richness and display. Under the empire there was developed from this Greek source a sculpture of truly Roman style, characteristic especially in its portrait-statues, in which the person represented is often

idealized as a god, and which are often highly naturalistic and skilful in treatment, and many of them excellent art as portraiture. Another chief development of Roman sculpture is the historical relief, illustrating all phases of Roman imperial life and triumphs. Though these reliefs are seldom artistic, the episodes which they present are precise in detail, and strikingly true to life. *Roman painting* in its origin, and with Fabius Pictor and Pacuvius, was Etruscan; in its development under the empire, when it was profuse in quantity, covering in general the interior walls of all buildings of any pretension, it was Greek, of the degenerated but clever and light style of Alexandria. At its best, as seen in many of the wall-paintings of Pompeii and of Rome, it is highly decorative; and it is especially valuable as preserving the chief material that survives for the study of the great Greek painters of the fifth and fourth centuries B. C. See *Panteleon*.—**Roman balance**. See *steelyard*.—**Roman camomile**, a cultivated form of the common camomile.—**Roman candle**, a kind of firework, consisting of a tube, which discharges a succession of white or colored stars or balls.—**Roman Catholic**, of or pertaining to the Church of Rome; hence, as a noun, a member of the Roman Catholic Church. Abbreviated *R. C.*—**Roman Catholic Church**, the popular designation of the church of which the Pope or Bishop of Rome is the head, and which holds him, as the successor of St. Peter and heir of his spiritual authority,

privileges, and gifts, as the supreme ruler, pastor, and teacher of the whole Catholic Church. Ecclesiastically, it is a hierarchy consisting of priests, bishops, and archbishops, presided over by the Pope, who is the supreme head of the church, and who is elected for life by the College of Cardinals from their own number. Every priest receives his consecration from a bishop or archbishop, and every bishop and archbishop holds his appointment from the Pope, by whose permission he must be consecrated. Celibacy is strictly enforced on the clergy. The doctrines of the church are contained in the decrees of the Council of Trent, and in a briefer form in the creed of Pius IV. (1564). This creed contains twelve articles, including an acceptance of the traditions and constitutions of the church and of the Scriptures as interpreted by the church; seven sacraments, necessary for the salvation of mankind, though not all for every individual—namely, baptism, confirmation, eucharist, penance, extreme unction, orders, and matrimony; the doctrines concerning original sin and justification defined by the decrees of the Council of Trent; the mass as a true propitiatory sacrifice; the real presence and transubstantiation; purgatory; the invocation of the saints; the veneration of images; indulgences; and the supremacy of the Pope. The last article, as since defined by the Vatican Council, involves the infallibility of the Pope. The worship of the Roman Catholic Church is an elaborate ritual, the central feature of it being the sacrifice of the mass, in which the real body and blood of Christ are believed to be corporally present, each repetition of the mass being regarded as a real sacrifice for sin and as exercising a real efficacy in securing the salvation of those who in faith assist at and partake of it. These doctrines and usages are, with some differences, largely also those of the Greek and some other churches. The most distinctive doctrines of the Roman Catholic Church are the papal supremacy and infallibility, the immaculate conception, and the purgatorial fire. Communion is given in one kind only.—**Roman Catholicism**, the principles, doctrines, rules, etc., of the Roman Catholic Church collectively.—**Roman Catholic Relief Acts**, a series of English statutes of 1829, 1833, 1834, 1843, 1844, and 1846, removing the political disabilities of Roman Catholics.—**Roman cement**. It was in no way a native school, being based on the art of Florence, and counting foreigners, for the most part, among its painters. Among the most prominent names of this school are Giulio Romano, Caravaggio, and the later Sassoferrato and Maratta.—**Roman string**, a peculiarly fine variety of catgut string for violins and similar instruments, made in Italy.—**Roman surface**, a surface invented by the geometer Steiner in Rome. Roman naturally applies to that which is especially associated or connected with the city, Rome; *Latin* to that which similarly belongs to the district, Latium. Hence, we speak of *Roman power*, fortitude, administration; the *Roman church*; the *Latin language*. Nearly all the use of *Latin* has grown out of its application to the language: as, *Latin grammar*; a *Latin idiom*; the *Latin Church*. The words are not interchangeable.

the relative position of the Jews and Gentiles to the law of God (natural and revealed), the rejection of the Jews, and the admission of the Gentiles. Abbreviated *Rom.*

L. Stevenson's "Strange Case of Dr. Jekyll and Mr. Hyde," or with morbid idiosyncrasies of temperament, as Godwin's "Caleb Williams," or picturing imaginary conditions of society influenced by imaginary characters, as Fouqué's "Undine." Romanus*, Roman: see *Roman* and *-esque*.] *I. a. 1.* Roman or Romance. Specifically, in art: (a) Belonging to or designating the early medieval style of art and ornament developed in western Europe from those of the later Roman empire.

The name *Romanesque*, which has been given to this style, very nearly corresponds with the term *Romance* as applied to a group of languages. It signifies the derivation of the main elements, both of plan and of construction, from the works of the later Roman Empire. But *Romanesque* architecture was not, as it has been called, "a corrupted imitation of the Roman architecture," any more than the Provençal or the Italian language was a corrupted imitation of the Latin. It was a new thing, the slowly matured product of a long period and of many influences.

Hence — (b) Same as *romantic*, 5.

2. Noting the dialect of Languedoc. See II., 2.—

3. [*l. c.*] Pertaining to romance; romantic. [A Gallicism.]—**Romanesque architecture**, a general and rather vague phrase including the styles of round-arched and vaulted architecture which prevailed in the West from the fifth to the middle of the twelfth century.

Romanesque.—Great Doorway of the Abbey Church of Vézelay, 12th century. (From Viollet-le-Duc's "Dictionnaire de l'Architecture.")

The Romanesque can be separated into two distinct divisions: (a) that but little removed from debased Roman, prevalent from the fifth to the eleventh century; and (b) the late, fully developed Romanesque of the eleventh and twelfth centuries, which comprises the advanced and differentiated Lombard, Rhenish, Saxon, Norman, and Burgundian styles. The latter division, while retaining the semicircular arch and other characteristic features of Roman architecture, is in every sense an original style of great richness and dignity, always inferior, however, to the succeeding Pointed style in the less perfect stability of its round arch and vault, the greater heaviness and less organic quality of its structure (the Romanesque architect, like the old Roman, still trusting for stability rather to the massiveness of his walls than, like his successor in the thirteenth century, to the scientific combination of a skeleton framework of masonry), the inferior flexibility of its design, and the archaic character of its figure-sculpture, of which much, however, is admirable in the best examples, particularly in France. See *medieval architecture* (under *medieval*), and compare cuts under *Norman*, *Rhenish*, and *medieval*.

II. *n.* 1. The early medieval style of architecture and ornament founded in the West upon those of the later Roman empire, and the varieties into which it is subdivided, known as *Lombard*, *Norman*, *Rhenish*, etc. See I.

Romaniform (rō-man'i-fōrm), *a.* [*< L. Romanus*, Roman, + *forma*, form.] Formed on the model of the Romance languages, as a phrase or term. Compare *Latiniform*. [Rare.]

The relative positions of the substantive and adjective are too inconstant in Latin to admit of generalization; but in the derivative Romance languages . . . the adjective almost invariably follows, while in the Germanic tongues it as commonly precedes; hence, strictly speaking, the two combinations should be called *Romaniform* and *Germaniform*, respectively.

(b) Noting an early medieval architectural style of much of northeastern Italy, in which Byzantine elements are modified by the influence of distinctively Romanesque or Western elements. It was due to the influence of the Byzantine Church of San Vitale at Ravenna, completed about A. D. 550.

As it [the Byzantine style] was gradually blended with the classical Roman, with which it was then first brought face to face, a third great style was formed, known as the *Romanesque*, *Romano-Byzantine*, *Lombard*, or *Comacine*. C. C. Perkins, *Italian Sculpture*, Int., p. x.

Sw. romantisk*, *a.*), *< F. romantique*, pertaining to romance, *< OF. romant*, a romance: see *romance* and *romant*.] *I. a. 1.* Pertaining to or resembling romance, or an ideal state of things; partaking of the heroic, the marvelous, the supernatural, or the imaginative; chimerical; fanciful; extravagantly enthusiastic: as, *romantic* notions; *romantic* expectations; *romantic* devotion.

So fair a place was never seen
Of all that ever charm'd *romantic* eye.

Keats, *Imitation of Spenser*.

A *romantic* scheme is one which is wild, impracticable, and yet contains something which captivates the young. Whately.

The poets of Greece and Rome . . . do not seem to have visited their great battle-fields, nor to have hung on the scenery that surrounded them with that *romantic* interest which modern poets do.

Shairp, *Poetic Interpretation of Nature*, p. 110.

4. 5. In arch. and art, fanciful; fantastic; not formal or classical; characterized by pathos. See *pathos*, 2.

There was nothing of classic idealism in his [the medieval church-builder's] work; it was modern and *romantic* in the sense that in it the matter predominated over the form.

Romantic school, a name assumed by a number of young poets and critics in Germany—the Schlegels, Novalis, Tieck, and others—to designate a combination of writers whose efforts were directed to the overthrow of the artificial rhetoric and unimaginative pedantry of the French school of poetry. The name is also given to a similar school which arose in France between twenty and thirty years later, and engaged in a long struggle for supremacy with the older *classic school*; Victor Hugo and Lamartine were among the leaders. From literature the name passed into music as the designation of a class of musicians having many of the characteristics of the *romantic* school of authors. See def. 4. = *Syn. 1. Romantic*, *Sentimental*. *Sentimental* is used in reference to the feelings, *romantic* in reference to the imagination. *Sentimental* is used in a sense unfavorable, but in all degrees: as, an amiably *sentimental* person; the *sentimental* pity that would surround imprisoned criminals with luxuries. "The *sentimental* person is one of wrong or excessive sensibility, or who imports mere sentiment into matters worthy of more vigorous thought." (C. J. Smith, *Syn. Disc.*, p. 680.) *Romantic*, when applied to character, is generally unfavorable, but in all degrees, implying that the use of the imagination is extravagant. A *romantic* person indulges his imagination in the creation and contemplation of scenes of ideal enterprise, adventure, and enjoyment.

A *romantic* tendency is often a part of the exuberance of youthful vitality, and may be disciplined into imaginative strength; *sentimentality* is a sort of mental sickness or degeneration, and is not easily recovered from.

II. n. An adherent of the romantic school. See *romantic school*, under I.

This is one form of *Ronde*.

rondeau (ron'dō), *n.* [*F. rondeau*, < *OF. rondel*, a roundel: see *roundel*.] 1. A poem in a fixed form, borrowed from the French, and consisting either of thirteen lines on two rhymes with an unrhyming refrain, or of ten lines on two rhymes with an unrhyming refrain. It may be written in octosyllabic or decasyllabic measure. The refrain is usually a repetition of the first three or four words, sometimes of the first word only. The order of rhymes in the thirteen-line rondeau, known technically as the "rondeau of Voiture" (that is, Vincent Voiture, 1598-1648), is *a, a, b, b, a; a, a, b* (and refrain); *a, a, b, b, a* (and refrain); that of the ten-line rondeau, known technically as the "rondeau of Villon" (that is, François Villon, 1431-1461?), is *a, b, b, a; a, a, b* (and refrain); *a, b, b, a* (and refrain). These are the strict rules; but, as in the case of the sonnet, both in France and England, they are not always observed. There is also a form called the *rondeau redoublé*. It consists of six quatrains, *a, b, a, b*, on two rhymes. The first four lines form in succession the last lines of the second, third, fourth, and fifth quatrains. At the end of the final quatrain, the first words of the poem are added as an unrhyming and independent refrain. Sometimes the final quatrain is styled the *envoi* or *envoy*.

This sort of writing, called the *rondeau*, is what I never knew practised in our nation. *Pope*.

2. In music. See *rondo*.

rondel (ron'del), *n.* [*OF. rondel*: see *roundel*.] A poem in a fixed form, borrowed from the French, and consisting of thirteen lines on two rhymes. It may be written in octosyllabic or decasyllabic measure. The first line is repeated at the close, and the first two lines are repeated as the seventh and eighth lines. Thus, the whole poem, like the *rondeau* (which see), falls into three divisions or stanzas—two of four, and one of five—arranged as follows: *a, b, b, a; a, b, a, b; a, b, b, a, a*. It is permissible to repeat the first couplet at the close, making the last division *a, b, b, a, a, b*, and fourteen lines in all. Rondels in English were written by Charles of Orleans, Chaucer, Occleve, Lydgate, and others.

In its origin the *rondel* was a lyric of two verses, each having four or five lines, rhyming on two rhymes only. In its eight (or ten) lines, but five (or six) were distinct, the others being made by repeating the first couplet at the end of the second stanza, sometimes in an inverse order, and the first line at the end of its first stanza. The eight-lined *rondel* is thus at all intents and purposes a triolet. . . . With Charles d'Orleans the *rondel* took the distinct shape we now assign to it, namely of fourteen lines on two rhymes, the first two lines repeating for the seventh and eighth and the final couplet. . . . By the time of Octavien de Saint Gelais (1466-1502) the *rondel* has nearly become the *rondeau* as we know it.

Gleeson White, *Ballades and Rondeaux*, Int., p. lviil.

rondelet (ron'de-let), *n.* [*OF. rondelet*, dim. of *rondel*, a roundel: see *roundel*, *rondel*, and cf. *rundlet*.] A poem of five lines and two refrains. The refrains repeat the first line, generally two words, the rhyme-scheme being *a, b* (and refrain); *a, b, b* (and refrain). It has been written in English, but not much.

Then have you also a *rondette*, the which doth always end with one self same foote or repetition, and was therefore (in my judgment) called a *rondette*.

Gascogne, *Notes on Eng. Verse* (Steele Glas., etc., ed. [Arber], § 14).

Rondeletia (ron-de-let'i-ä), *n.* [NL. (Plumier, 1703), named after Guillaume Rondelet (1507-1566?), a French professor of medicine.] A genus of gamopetalous shrubs and trees of the order Rubiaceae, type of the tribe *Rondeletieae*. It is characterized by a globose calyx bearing four or five narrow, persistent, and nearly equal lobes, by a wheel-shaped or salver-form corolla with a long slender tube and four or five obovate broadly imbricating lobes, and by the locicled capsule, which is small, rigid, globose, two-furrowed, and two-valved. There are about 60 species, natives of the West Indies and tropical America from Mexico to the United States of Colombia, rarely extending into Guiana and Peru. They bear opposite or whorled leaves, which are thin or coriaceous and sessile, furnished with broad stipules between the petioles. Their small flowers are white, yellow, or red, and usually in axillary flattened, rounded, or panicle cymes. Various handsome species are cultivated under glass, among them *R. odorata*, with fragrant scarlet flowers, and *R. versicolor*, whose deep rose-colored flowers become paler after expansion. Some species are still known as *Rogiera*, the name of a former genus, including species with connate stipules and corolla hairy in the throat.

P. de Candolle, 1830), < *Rondeletia* + *-æ*.] A tribe of gamopetalous plants of the order Rubiaceae, characterized by the exceedingly numerous minute albuminous wingless seeds which fill the two cells of the dry capsule, and by the regular corolla with imbricated or contorted lobes. It includes 14 genera of shrubs and trees, with stipulate leaves and cymose, spiked, or variously clustered flowers, and 2 genera of herbs, without stipules, bearing terminal three-forked cymes. The species are tropical and mainly American. See *Rondeletia*, the type.

the chancel, or over the rood-screen. The front of the loft, like the screen below, was usually richly ornamented with tracery and carvings, either in wood or in stone. It was often approached by a small staircase in the wall of the building. This feature does not appear in modern churches, and has now been removed from a large proportion of the medieval churches. The rood-loft originated from a combination of the rood beam and ambo. The center was used as ambo (jube), and the epistle and gospel were read and announcements made from it. It was placed over the entrance to the choir, so that both could stand in the middle line (longitudinal axis) of the church, and the approach to it was made from the side of the church along a broadened rood-beam or loft crowning the rood-screen. Cf. Icel. *rāf*, also *rāfr*, mod. *ræfr*, a roof; Russ. *krovā*, a roof; perhaps akin to Gr. *κρίπτεω*, hide (see *crypt*).] 1. The external upper covering of a house or other building. Roofs are distinguished

(1) by the materials of which they are mainly formed, as thatch, stone, wood, slate, tile, iron, etc., and (2) by their form and mode of construction, in great variety, as shed, curb, hip, gable, pavilion, ogee, and flat roofs. The span of a roof is the width between the supports; the rise is the height of the ridge of the highest part above the level of the supports; the pitch is the slope or angle at which it is inclined. In carpentry, roof signifies the timber framework by which the roofing or covering materials of the building are supported. This consists in general of the principal rafters, the purlins, and the common rafters. The principal rafters, or principals, as they are commonly termed, are placed so as to span the building at intervals usually of 10 or 12 feet; the purlins lie horizontally upon these, and sustain the common rafters, which carry the covering of the roof. The accompanying figure shows one of

the two varieties of principals which are in common use (the king-post principal, with the purlins and common rafters in position. (For a diagram of the second, the queen-post principal, see *queen-post*.) Each of these modes of framing constitutes a truss. Sometimes, when the width of the building is not great, common rafters are used alone to support the roof. They are in that case joined together in pairs, nailed where they meet at the top, and connected by means of a tie at the bottom. They are then termed *couples*, a pair forming a *couple-close*. See also cuts under *hammer-beam*, *hip-roof*, *jerkin-head*, *M-roof*, *pendent*, and *pendentive*.

(b) A roof but slightly inclined for the discharge of water. Roofs of this form are common in city buildings, especially in the United States, and are usually covered with sheet-metal.—**French roof**, a form of roof with almost vertical sides, sometimes concave or even convex, and the top usually flat or sloping toward the rear. O. W. Holmes, Autocrat, vi.

3. The fowls which occupy such a roost, collectively. A somewhat special application of the word (like *rookery*, 2) is to the roosts of some perching birds, which assemble in vast numbers, but not to breed, and for no obvious purpose that would not be as well attained without such congregation. Among conspicuous instances may be noted the roosts of the passenger-pigeon, sometimes several miles in extent, and the winter roosts of many thousands of crows (see *crows*, 2), which in the breeding season are dispersed. It is not generally known that the common robin of the United States sometimes forms such roosts in summer.

See also *root*².] 1. (a) In bot., a part of the body of a plant which, typically, grows downward into the soil, fixes the plant, and absorbs nutriment. A root may be either a descending axis originating in germination from the lower end of the caulicle, and persisting as a *tap-root*, or one of a group of such roots—in either case called *primary*; or a branch of such a root, the ultimate ramifications forming rootlets or *root-fibrils*; or a similar organ developed from some other part of the plant (adventitious), sometimes with special functions—in the latter cases called *secondary*. The root differs from the stem in having no nodes and internodes, its branches appearing in no regular order, and, normally, in giving rise to no other organs, though, as in the pear and poplar, it may develop buds and thence suckers. In mode of growth the root is peculiar in elongating only or chiefly at the extremity, and at the same time in not building upon the naked apex, but in a stratum (the growing-point) just short of the apex under the protection of a cover or sheath—the *root-cap* (which see). Aside from securing the plant in position, the ordinary function of roots is the absorption of water with nutritive matter in solution from the soil, or, in the case of aquatics, wholly or partly from the water. This office is performed by imbibition through the cell-walls of the fresher root-surface, except that of the extreme tip, the absorbent surface being greatly increased by the production of root-hairs. (See *root-hair*.) Many

roots, however—chiefly the tap-roots of biennials—serve the special purpose of storing nutriment for a second season, becoming thus much enlarged, as in the beet and turnip. Roots of this class must be distinguished from the rhizome, bulb, etc., which, though subterranean, are modifications of the stem. Numerous plants put forth aerial roots, eventually reaching the soil (banian, mangrove),

Various Forms of Roots.
1. Fibrous Roots of *Poa annua*. 2. Root of *Daucus Carota*: R. tap-root; r. r. rootlets. 3. Aerial Roots of *Oncidium (Vittatum)*. 4. Tuberous Roots of *Anemone thalictrifolia*. 5. Root-hairs of *Yucca gloriosa* (highly magnified).

serving as means of climbing (ivy, poison-ivy), or, in the case of epiphytes, part fastening the plant to a bough, part free in the air, whence they are capable of absorbing some moisture. The roots of a parasitic plant penetrate the tissues of the host-plant and draw their nutritive matter from it. True roots are confined to flowering plants and vascular cryptogams, the rhizoids of many lower plants in part taking their place. See *annual*, *biennial*, *perennial*. See also cuts under *ivy*, *monocotyledonous*, *prothallium*, and *rhizome*.

2. That which resembles a root in shape, position, or function; that from which anything springs. (a) The part of anything that resembles the root of a plant in manner of growth, or as a source of nourishment, support, or origin; specifically, in anat. and zool., some part or organ like or likened to the root of a plant; the deepest or most fixed part of something embedded in another; a base, bottom, or supporting part; technically called *radix*: as, the root of a finger-nail or a tooth; the root of a nerve or a hair: often used in the plural, though the thing in fact is singular: as, to drag out a nail by the roots.

(e) In philol., an elementary notional syllable; that part of a word which conveys its essential meaning, as distinguished from the formative parts by which this meaning is modified; an element in a language, whether arrived at by analysis of words or existing uncombined, in which no formative element is demonstrable: thus, *true* may be regarded as the root of *un-tru-th-ful-ness*.

But we must beware of pushing the figure involved in *root* to the extent of regarding *roots* thus set up as the elements out of which the language containing them has grown. A given *root* may be more modern than certain or than all of the formative elements with which it is combined.

Whitney, Trans. Amer. Philol. Ass., XVII., App., p. xx.

Equity and equal are from the same root; and equity literally means equality.

H. Spencer, Social Statics, p. 109.

(f) The first ancestor; an early progenitor.

Myself should be the root and father
Of many kings. Shak., Macbeth, III, 1. 5.

(g) In math.: (1) The root of any quantity is such a quantity as, when multiplied into itself a certain number of times, will exactly produce that quantity. Thus, 2 is a root of 4, because when multiplied into itself it exactly produces 4. Power and root are correlative terms: the power is named from the number of the factors employed in the multiplication, and the root is named from the power. Thus, if a quantity be multiplied once by itself, the product is called the *second power*, or *square*, and the quantity itself the *square root*, or second root of the product; if the quantity be multiplied twice by itself, we obtain the *third power*, or *cube*, and the quantity is the *cube root* or third root; and so on. The character marking a root is $\sqrt{}$ (a modification of r for *radix*, which has been used probably since the middle of the sixteenth century), and the particular root is indicated by placing above the sign the figure which expresses the number of the root, which figure is called the *index* of the root. Thus, $\sqrt[4]{16}$ indicates the fourth root of 16 (that is, 2), and $\sqrt[4]{4}$ the square root of 4 (that is, 2)—the index in the case of the square root being usually omitted. The same is the case with algebraic quantities, as $\sqrt[3]{a^3 + 3a^2b + 3ab^2 + b^3} = a + b$. See *power*, *index*, *involution*, *evolution*. (2) The root of an equation is a quantity which, substituted for the unknown quantity, satisfies the equation: thus, $2 + \sqrt{2}$ is a root of the equation $x^3 - 5x^2 + 6x - 2 = 0$; for

$$\begin{aligned} (2 + \sqrt{2})^3 &= 20 + 14\sqrt{2} \\ - 5(2 + \sqrt{2})^2 &= -30 - 20\sqrt{2} \\ + 6(2 + \sqrt{2}) &= 12 + 6\sqrt{2} \\ - 2 &= -2, \end{aligned}$$

the sum of which is 0. Another root of the same equation is obviously 1; and the third root will be found to be $2 - \sqrt{2}$.

(h) In music: (1) With reference to a compound tone or a series of harmonics, the fundamental, generator, or ground tone. (2) With reference to a chord, the fundamental tone—that is, the tone from whose harmonics the tones of the chord are selected, or the tone on which they are conceived to be built up. Theorists are not agreed as to what constitutes a root of a chord, or whether a chord may have two roots; and in many cases the term is used merely to designate the lowest tone of a chord when arranged in its simplest or normal position. (i) In chron., the earliest time at which an event can take place, as a movable feast; also, the time at which any progressive change begins. (j) In astrol., the state of things at the beginning of any time; particularly, the figure of the heavens at the instant of birth, specifically called the *root of nativity*, a term also applied to the horoscope, or ascendant. Chaucer, in the passage below, has in mind the introduction to Zabel's treatise on Elections, where it is stated that elections of fortunate times for undertakings are not much to be depended upon, except in the case of kings, who have their *roots of nativity* (that is, in their case there is no doubt as to the precise aspect of the heavens at the moment of birth), which roots strengthen the inferences to be drawn, especially (at least so Chaucer understands the words) in the case of a journey. When the horoscope of birth was not known, astrologers were accustomed to determine elections chiefly by the place and phase of the moon, whose influence was, however, considered debile. It appears that in the case of the lady of the story, the moon was impeded in the *root of nativity* (see Almonson, Prop. 35: "Cum in radice nativitas impediatur luna," etc.) and Mars, a planet most unfavorable to journeys, was at *azil*, or lord of the ascendant, at her birth, and was in the fourth, or darkest, house; so that the omens of the journey were as gloomy as they well could be.

The word *rope* exists disguised in the second element of *stirrup*.] 1. A cord of considerable thickness; technically, a cord over one inch in circumference. Ropes are usually made of hemp, manila, flax, cotton, coil, or other vegetable fiber, or of iron, steel, or other metallic wire. A hempen rope is composed of a certain number of yarns or threads, which are first spun or twisted into strands, and the finished ropes have special names according to the number and arrangement of the strands, and the various sizes are indicated by the circumference in inches. The ropes in ordinary use on board a vessel are composed of three strands, laid right-handed, or, as it is called (though this is not correct for southern latitudes), "with the sun." Occasionally a piece of large rope will be found laid up in four strands, also with the sun. This is generally used for standing rigging, tacks, sheets, etc., and is sometimes called *shroud-laid*. In nautical language a rope is usually called a *line*.

2. A row or string consisting of a number of things united so as to form a cord more or less thick: as, a *rope of onions*; a *rope of pearls*.

3. Anything glutinous or gelatinous which is drawn out in long strings.

4. A local linear measure, twenty feet; in Devonshire, a measure of stonework, 20 feet in length, 1 foot in height, and 18 inches in thickness.—**Cable-laid rope**, a rope composed of nine strands. It is made by first laying the strands into three ropes of three strands each, right-handed; and then laying the three ropes up together into one, left-handed.

Thus, cable-laid rope is like three small common ropes laid up into one large one. Formerly the ordinary three-stranded right-hand rope was called *hawser-laid*, and the nine-stranded *cable-laid*, and they will be found so distinguished in books; but among seafaring men now the terms *hawser-laid* and *cable-laid* are applied indiscriminately to nine-stranded rope, and the three-stranded, being the usual kind of rope, has no particular name, or is called *right-hand rope*. See *cut under cable-laid*.—**Cat-block rope**. See *cat-block*.—**Clue-rope**, a rope fastened to the clue of a course and used as a temporary tack or sheet.

See *holy*.—**In the rope**, in the original twist or braid as delivered by the factory: said of horsehair used in upholstery, and of similar fibers which are put up in this form.—**Laid rope**, a rope that is twisted in strands. See *cable-laid rope*.—**Left-hand rope**, rope which is laid up and twisted from right to left, or "against the sun," as it is termed (see def. 1). Also called *backhanded rope*, *water-laid rope*.—**Locked-wire rope**, wire rope having the outer layer or layers of wires so made that they interlock each other. It is intended to prevent broken wires from springing out of place; the adjoining wires are supposed to hold them down.—**Manila rope**, rope made from Manila hemp. See *manila*, 2.—**On or upon the high ropes**. (a) Elated; in high spirits. (b) Haughty; arrogant.

He is one day humble, and the next day on the *high ropes*.

Swift, *Journal to Stella*, xxvi.

Plain-laid rope, rope made by twisting three strands together right-handed, or from left to right.—**Right-hand rope**, the three-stranded rope ordinarily used, which generally bears this name: it is laid "with the sun" (see def. 1). See *cable-laid rope*, above.—**Rope bridge**. See *bridge*.—**Rope driving-gear**. See *gear*.—**Rope ladder**, a ladder made by connecting two long pieces of rope at regular intervals by shorter pieces, or by rounds of wood or metal.

—**Rope of sand**, proverbially, a feeble union or tie; a band easily broken.—**Rope's end**, the end of a rope; a short piece of rope, often used as an instrument of punishment.

Among my wife and her confederates

For locking me out of my doors by day.

Shak., C. of E., iv. 1. 16.

Shroud-laid rope, rope made by laying four strands together right-handed: it takes its name from the use to which it is frequently applied. All four-stranded rope is made with a central strand called a *heart*, which assists in keeping the others in place.—**Straw rope**, a rope made of straw twisted. It is used to secure the thatch of corn-ricks and -stacks, and also the thatch of poor cottages.—**Tapered rope**, rope made larger at one end than

the other, used where there is considerable travel to the rope, and where much strain is brought on only one end, such as the fore- and main-tacks and -sheets.—**To back a rope**. See *back*.—**To be at the end of one's rope**, to have exhausted one's powers or resources.—**To cap a rope**. See *cap*.—**To give a person rope**, to let him go on without check, usually to his own defeat or injury.—**To know the ropes**. See *know*.—**To lay, overhaul, point a rope**. See the verbs.—**Twice-laid rope**, rope made from yarns that have already been used in other ropes.—**White rope**, rope not saturated with tar; untarred rope.—**Wire rope**, a collection of wires of iron, steel, etc., twisted, or (less usually) bound together so as to act in unison in resisting a strain. They are extensively used in raising and lowering apparatus in coal-mines, as standing rigging for ships, as substitutes for chains in suspension-bridges, for telegraph-cables, etc.

These are lowered as the hole deepens by letting out the so-called "temper-screw," and they are rotated constantly by the driller by means of a short lever. The jars, by means of the vibrations communicated through the rope, show the driller how the tools are working. Also called *cable-drilling*.

The ancient custom of *rope-pulling* is always strictly observed in Ludlow on Shrove Tuesday. At about four o'clock in the afternoon the rope is given out from the town-hall by the Mayor, on whom this important duty by right devolves. Immediately on the rope being let down from a window, an indescribable struggle and trial of strength commences between the denizens of the different wards, which is not concluded without an obstinate contention. There are afterwards ordinaries at the various inns, and pleasure and conviviality are the order of the day. *Halliwel.*

The 2 species are natives of the Cape of Good Hope. They are very leafy and glandular-hairy undershrubs, bearing narrow entire or pinnatifid leaves, circinnately coiled in the bud, and rather large red or white two-bracted flowers forming a terminal raceme or spike. *R. dentata* is a shrubby herb 3 feet high, with the leaves so viscid that it is hung up as a flycatcher in Cape country-houses.

Some of these whales attain great size, the common rorqual, *B. musculus*, reaching a length of 60 or 70 feet, while the blue rorqual, *B. sibbaldi* or *Sibbaldius maximus*, is sometimes 80 feet, being thus the longest known mammal. Rudolph's rorqual, *B. borealis*, is about 50 feet long; the lesser rorqual, *B. rostrata*, 30 feet. These four are well-established species in North Atlantic waters, though their synonymy has been much confused by the introduction and cross-use of various generic names. It is characterized by an urn-shaped calyx-tube with constricted mouth, bearing five leaf-like imbricated lobes, destitute of the intermediate bractlets which are frequent in related genera, but often furnished with similar smaller leaf-like lobes on their sides. It is also distinguished by the broad and open corolla of five obovate petals, numerous stamens in many rows, and many free carpels each with one pendulous ovule, a ventral style, and a somewhat dilated stigma, and each forming in fruit a one-seeded bony achene, the whole mass of achenes inclosed in a fleshy fruiting receptacle, known as the *hip* or *hep*. (See *Rosaceae*.) The species are polymorphous and variable, and though 600 have been enumerated (exclusive of garden varieties), they are believed to be reducible to 50 or 55. They inhabit temperate and subalpine regions through a large part of the northern hemisphere, being limited southward by India, Abyssinia, and Mexico, and being less numerous in America than in the Old World. *R. cinnamomea* is said to be found as far north as Point Barrow in Alaska (71° 27'). Ten species are native in the northeastern United States, of which one, *R. blanda*, extends to Hudson's Bay. Five species are found in Great Britain, or, as they are sometimes classified, 20. They are erect or climbing shrubs, commonly with prickly stems, the leaves smooth, silky, or downy, or (in *R. rubiginosa*, the sweetbrier) beset with copious minute glands beneath and fragrant. The leaves are alternate and unequally pinnate, with adherent wing-like stipules and serrate leaflets; in *R. berberifolia*, a small yellow-flowered Persian species, they are reduced to a single leaflet or are replaced wholly by stipules. The flowers are large and beautiful, often fragrant, made double in cultivation by the transformation of part or all of the stamens into petals, and also so occurring rarely in the wild state. They are of numerous shades of red, white, and yellow, and often over 2 inches across, in *R. gigantea*, of Upper Burma, reaching 6 inches. The scarlet or crimson fruit is often ornamental and sometimes edible. See *rose*.

Rosaceae (rō-zā'sē-ē), *n. pl.* [NL. (Jussieu, 1789), fem. pl. of *L. rosaceus*: see *rosaceous*.] An order of polypetalous plants, of the cohort *Rosales*; the rose family. It is characterized by

a calyx of five lobes often alternating with five bractlets; by a calyx-tube sheathed by a disk which bears the five uniform petals and the one or more complete circles of numerous stamens; and by the usually several or many separate carpels inserted at the base or throat of the calyx-tube, each with a basilar or ventral style, and usually with two anatropous ovules which are pendulous or ascending. Some yellow- or white-flowered species suggest by their appearance the buttercup family, *Ranunculaceae*, but their numerous stamens and pistils are inserted on the calyx or disk, not on the receptacle. The rose family is closely allied to the *Leguminosae*; but in that order the fifth petal, in this the fifth sepal, is nearest the axis of the plant. The resemblance is most strongly marked between the drupaceous *Rosaceae* and the *acacias*. The order passes gradually, through the spiraeas, into the saxifrage family, but is distinguished in general by its inflorescence, its exalbuminous seeds, and its commonly numerous pistils. Its species are properly about 1,000, though over 2,000 have been enumerated. They are classed in 71 genera composing 10 tribes (*Chrysobalanaceae*, *Pruneeae*, *Spiraeae*, *Quillaieae*, *Rubeeae*, *Potentilloideae*, *Potriceae*, *Roseae*, *Neridaeae*, and *Pomeae*). These are often grouped in 3 subfamilies, *Drupaceae*, *Pomeae*, and *Rosaceae* proper. They are natives both of temperate and of tropical regions, extending southward principally in the tribes *Chrysobalanaceae* and *Quillaieae*; 4 genera reach Australia, 4 South Africa, and 4 or 5 Chili. The chief home of the order, however, is the north temperate zone, whence it extends into the extreme north. More than 25 species occur in Alaska, while the genera *Alchemilla*, *Potentilla*, and especially *Dryas*, furnish characteristic arctic plants, the last affording the most common plant found by the Greely arctic expedition, forming beds covering acres in the interior of Grinnell Land, and flourishing on Lockwood's island, latitude 83° 24' N. The order includes herbs, trees, and shrubs, either erect or prostrate, rarely climbing. Their leaves are generally alternate, either simple or compound, often with glandular teeth, accompanied by stipules, these being free or adherent to the petiole, which is frequently dilated at the base and gland-bearing at the summit. The flowers are very often showy, commonly red, white, or yellow, but not blue, of very various inflorescence, either solitary or in racemes, spikes, panicles, or cymes. The order offers examples of widely different types of fruit, as the drupe, pome, follicle, and achene, with many specialized fruiting-bodies, as the rose-hip, the fleshy receptacle of the strawberry, and the drupelet or collection of small drupes found in the raspberry, and, with the addition of a fleshy receptacle, in the blackberry. The true berry and the capsule are, however, but seldom produced in this family. Many of the most valued fruit-trees belong here, as the apple, pear, plum, cherry, peach, and apricot; and many of the most common ornamental flowering shrubs of cultivation, for which see *Rosa* (the type), *Spiraea*, *Kerria*, *Photinia*, *Pyrus*, *Prunus*, etc.; together with many weedy plants, as *Agrimonia*, *Geum*, *Potentilla*.

(Lindley, 1833), pl. of *L. *rosalis*: see *rosal*.] A cohort of dicotyledonous plants, of the polypetalous series *Calyciflorae*, characterized by distinct styles and solitary or numerous and separate carpels, not united into a syncarpic ovary as in the other cohorts of the series. The leaves are either compound or simple, and the flowers either regular or irregular, but commonly unisexual. It includes 9 orders, 3 of which are small families with a pendulous apical ovule—the *Hamamelidaceae*, trees and shrubs, *Bruniaceae*, heath-like shrubs, and *Haloragaceae*, chiefly aquatic; 1, a small family with parietal ovules—the *Droseraceae*, glandular herbs; and the 5 others, families with ovules ascending or affixed to the central angle—the large orders *Leguminosae*, *Rosaceae*, and *Saxifragaceae*, together with the *Convolvaceae*, tropical trees and shrubs, and the *Crossulaceae*, fleshy herbs.

iline coloring matters of commerce; also, the color thus produced. Thus, fuchsin is the monohydrochloride and azalein the nitrate of rosaniline. Silk and wool dipped into aqueous solutions of any of the salts withdraw them from solution and become dyed at once. Cotton, on the other hand, does not withdraw the coloring matter, but must be first treated with a mordant of some animal substance, such as albumen. Also called *andine red*, *roseine*, *magenta*, *azalein*.—*Diphenyl rosaniline*, an aniline dye giving a blue-violet color.—*Rosaniline-blue*. Same as *spirit-blue*.

A string of beads carried about the person, either for mere pastime, as to occupy the fingers, or for reckoning, especially in numbering the prayers offered up at fixed times of the day. Mohammedans carry rosaries with them for both these purposes, wearing them in the girdle or carrying them in the hand at all hours of the day.

6. Specifically, in the *Rom. Cath. Ch.*: (a) A series of devotions consisting of a specified number of aves (that is, salutations to the Virgin Mary), of paternosters (that is, repetitions of the Lord's Prayer), and of glorias (or doxologies).

Our Lady's Psalter . . . is now better known as the *Rosary*. *Rock*, *Church of our Fathers*, III. l. 320.

(b) A string of beads of various sizes representing the same number of aves, paternosters, and glorias respectively, used for marking off these prayers. Each bead receives the name of the prayer it represents. The rosary is divided into decades of aves, each decade being preceded by a paternoster and followed by a gloria. The ordinary rosary, sometimes called the *Dominican rosary*, consists of fifteen decades—that is, of one hundred and fifty aves (corresponding to the number of psalms in the Psalter), fifteen paternosters, and fifteen glorias. In this rosary each decade is devoted to the contemplation of a mystery of the life of Christ, the first five being joyful mysteries (such as the annunciation and the nativity), the second five being the sorrowful mysteries (such as the passion), the third five being the glorious mysteries (such as the resurrection and ascension). This regular use of the rosary of one hundred and fifty aves was first instituted by St. Dominic (1170-1221), although the devotional use of beads, etc., was already familiar. The term *rosary* also applies to a similar instrument of devotion in use among the Greeks, Armenians, and other Eastern communions. See *chaplet*, 5.

The *AS. rōse* (*ME. rose*, *roose*) would reg. produce a mod. *E. *roose*; the mod. *E. rose* is due partly to the *F. form*.] *I. n. 1.* A shrub of the genus *Rosa*, or its flower, found wild in numerous species, and cultivated from remote antiquity. In the wild state the rose is generally single, its corolla consisting of one circle of round-

ish spreading petals. Under cultivation the petals commonly multiply at the expense of the stamens, the flower thus doubling into a cushion-, nest-, or cabbage-shaped body. Starting with a few natural species, cultivation has obtained, through selection and complex intercrossing, many hundred varieties, whose parentage frequently

cannot be conjectured. Some, however, remain near their originals, and very many can be referred to certain general stocks. For practical purposes the roses of culture have been loosely grouped as follows: (1) Climbing roses. Here belong the prairie-rose, and its offspring the queen-of-the-prairies, Baltimore belle, etc., and the evergreen, Ayrshire, musk, many-flowered, and Banksian stocks (see below). (2) Garden roses, non-climbers, blooming but once in the season; summer or June roses. Among these are the Scotch roses, derived from the burnet-rose, *R. spinosissima* (*R. pimpinellifolia*), a low bush of temperate Europe and Asia; the cinnamon- and damask-roses; the Provins, hundred-leaved, or cabbage rose, *R. centifolia*, among whose numerous varieties are most of the moss-roses; and the French or red rose, *R. Gallica*, prolific of variegated and other varieties. These are old favorites, now giving way to the next class. (3) The so-called hybrid perpetuals or autumn roses, best called *remontants* (see *remontant*), as blooming not perpetually, but a second time after rest. The characteristic element in this group is from the China or Indian rose, *R. Indica*. They are large, brilliant, and hardy, afford the great fancy roses of the rosarians, and include such varieties as the *Baronne Prévost*, *General Jacqueminot*, and *giant-of-battle*. The Jacqueminot is forced in immense quantities for the market. (4) Roses blooming continuously. Here may be classed the *Bourbons*, originating in a cross between the China and a damask variety, a rather tender race, including the *Souvenir de Malmaison*, a famous standard. More constant bloomers are varieties of the China rose known popularly as *monthly roses*, also called *Bengal roses*; the flowers are brilliant and abundant; the plant multiplies readily, and is the best for house culture. Another race of perpetuals is the *noisette*, derived from the musk- and the tea-rose, mostly climbers. Lastly, here belong the tea-roses, or tea-scented roses, descended from var. *odorata* of the China rose, a race of numerous and increasing varieties, most extensively cultivated. The large yellow *Maréchal* (or *Marshal*) *Niel*, highly popular for forcing, is by some classed as a tea-rose, by others as a *Noisette*. In England roses called *standards* are produced by budding the desired variety on the stock of the common dogrose, or of a vigorous variety known as *Manetti*; in the American climate most sorts do better on their own stock. The rose in culture has numerous enemies, as the rose-aphis or greenfly, the rose-beetle, the rose-slug, and the red-spider. The most important economical use of the rose is in the manufacture of attar or oil of roses. (See *attar* and *rose-water*.) The petals of the red or French rose are slightly astringent and tonic, and are used in various official preparations, chiefly as a vehicle for stronger tonic astringents. The petals of the cabbage-rose are slightly laxative, but are used chiefly in making rose-water. The bright-red hip of some wild roses is ornamental and sometimes edible; that of the dogrose is used to make a confection. The rose is a national emblem of England.

5. A light crimson color. Colors ordinarily called crimson are too dark to receive the name of *rose*. See II.

Her cheek had lost the rose. *Tennyson*, *Enone*.

6. In *her.*, a conventional representation of the flower, composed of five leaves or lobes, or, in other words, a kind of cinquefoil: when the five spaces between the leaves are filled by small pointed leaves representing the calyx, it is said to be *barbed*. (See *barb*¹, *n.*, 8.) The center is usually a circle with small dots or points of a different tincture, usually or. These may be supposed to represent the stamens, but they are called in heraldry *seeds*, and when they are of a different tincture the rose is said to be *seeded*.

7. In *arch. and art*: (a) A rose-window. (b) Any ornamental feature or work of decorative character having a circular outline: properly a larger and more important feature or work than a rosette or a circular boss.—8. A rosette, as of lace.—9. In *zool.*, a formation suggestive of a rose; a radiating disposition or arrangement of parts; a rosette, as that formed at the parting of feathers on the heads of domestic pigeons of different breeds, or that represented by caruncles about the eyes or beak. Compare *rose-comb*, under *comb*¹, 3.

In musical instruments like flutes, guitars, dulcimers, and harpsichords, an ornamental device set in the sound-hole of the belly, and often serving as a trade-mark as well as a decoration.—16. A form in which precious stones, especially small diamonds, are frequently cut. Large rose diamonds were much used from the sixteenth to the eighteenth century, but are now quite obsolete. The characteristic of the rose is that it is flat below, and forms a hemisphere or low pyramid above, covered with small facets. When, as is usually the case, these facets are 24 in number, the cut is called a *Dutch rose*; when 36, a *rose recoupée*. The *Brabant rose* has also 24 facets, but they are flatter or less raised than in the Dutch rose. The rose cut is selected when the loss to the stone in cutting would be too great if the brilliant cut were selected. Rose diamonds are generally cut from plates cleaved from the crystals of diamonds while being cleaved into brilliant form. See *brilliant*.

17. A very small diamond, scarcely more than a splinter, of which as many as 400 are sometimes necessary to make a carat, or 60,000 to make an ounce. These are seldom regularly cut, 6 to 8 facets only being the usual number.—**Alpine rose**, *Rosa alpina* of European mountains, to which are commonly referred the Boursault roses. To undergo natural decomposition; fall into a course or a state of elemental dissolution; suffer loss of coherence from decay: used of organic substances which either do or do not putrefy in the process, and sometimes, by extension, of inorganic substances.**

=Syn. 1. *Rot, Decay, Putrefy, Corrupt, Decompose.* Rot is, by its age and brevity, so energetic a word that it is often considered inelegant, and decay is used as a softer word. That which *rots* or *decays* may or may not emit a foul odor, as an egg or an apple; *putrefy* by derivation implies such foulness of odor, and hence is especially applied to animal matter when it is desired to emphasize that characteristic result of its rotting. *Corrupt* is sometimes used as a strong but not offensive word for thorough spoiling, that makes a thing repulsive or loathsome. To *decompose* is to return to the original elements; the word is sometimes used as a euphemism for *rot* or *putrefy*. The moral uses of the first four words correspond to the physical.

II, *trans.* 1. To cause decomposition in; subject to a process of rotting; make rotten: as, dampness *rots* many things; to *rot* flax. See *ret¹*. Sometimes used imprecipitatively in imprecation. Compare *rat³*, *drat²*.

rot (rot), *n.* [Early mod. E. also *rott*; **< ME. rot, rott, rote, rotte = MD. rot, rottenness: see rot, v.**] 1. The process of rotting, or the state of being rotten; also, rotted substance; matter weakened or disintegrated by rotting.

I will not kiss thee; then the *rot* returns To thine own lips again. *Shak.*, *T. of A.*, iv. 3. 63.

2. A condition of rottenness to which certain animals and plants are liable, as the sheep and the potato (see *potato*), attended by more or less putrescence. (a) The rot in sheep, which sometimes affects other animals also, is a fatal distemper caused by the presence of a great number of entozoa, called liver-flukes (*Distoma hepaticum*), in the liver, developed from germs swallowed with the food. The disease is promoted also by a humid state of atmosphere, soil, and herbage. It has different degrees of rapidity, but is generally fatal. (b) In botany *rot* is a general term somewhat loosely applied to cases of the breaking down of the tissues of plants by the destructive agencies of fungi, especially saprophytic fungi and bacteria, but also parasitic fungi. The attacks of parasitic forms, the punctures of insects, and mechanical injuries to plants are frequently followed by decay or rot, since these accidents permit the introduction of bacteria, which are very active agents. The rot may be either "dry" (see *dry-rot*) or "wet"—that is, it may or may not be accompanied by moisture: both kinds may be seen in the potato-rot, which is caused by the fungus *Phytophthora infestans*. The so-called black rot of the grape is caused by *Phoma viticola*, the white rot by *Coniophthora diplodiella*, the brown rot by *Peronospora viticola*, and the bitter rot by *Greeneria fuliginosa*. The brown rot of the cherry is caused by *Monilia fructigena*. See *potato-rot*, *Phytophthora*, *grape-rot*, *Phoma*, *Peronospora*.

That which *rots* or *decays* may or may not emit a foul odor, as an egg or an apple; *putrefy* by derivation implies such foulness of odor, and hence is especially applied to animal matter when it is desired to emphasize that characteristic result of its rotting. *Corrupt* is sometimes used as a strong but not offensive word for thorough spoiling, that makes a thing repulsive or loathsome. To *decompose* is to return to the original elements; the word is sometimes used as a euphemism for *rot* or *putrefy*. The moral uses of the first four words correspond to the physical.

II, *trans.* 1. To cause decomposition in; subject to a process of rotting; make rotten: as, dampness *rots* many things; to *rot* flax. See *ret¹*. Sometimes used imprecipitatively in imprecation. Compare *rat³*, *drat²*.

I will not kiss thee; then the *rot* returns To thine own lips again. *Shak.*, *T. of A.*, iv. 3. 63.

2. A condition of rottenness to which certain animals and plants are liable, as the sheep and the potato (see *potato*), attended by more or less putrescence. (a) The rot in sheep, which sometimes affects other animals also, is a fatal distemper caused by the presence of a great number of entozoa, called liver-flukes (*Distoma hepaticum*), in the liver, developed from germs swallowed with the food. The disease is promoted also by a humid state of atmosphere, soil, and herbage. It has different degrees of rapidity, but is generally fatal. (b) In botany *rot* is a general term somewhat loosely applied to cases of the breaking down of the tissues of plants by the destructive agencies of fungi, especially saprophytic fungi and bacteria, but also parasitic fungi. The attacks of parasitic forms, the punctures of insects, and mechanical injuries to plants are frequently followed by decay or rot, since these accidents permit the introduction of bacteria, which are very active agents. The rot may be either "dry" (see *dry-rot*) or "wet"—that is, it may or may not be accompanied by moisture: both kinds may be seen in the potato-rot, which is caused by the fungus *Phytophthora infestans*. The so-called black rot of the grape is caused by *Phoma viticola*, the white rot by *Coniophthora diplodiella*, the brown rot by *Peronospora viticola*, and the bitter rot by *Greeneria fuliginosa*. The brown rot of the cherry is caused by *Monilia fructigena*. See *potato-rot*, *Phytophthora*, *grape-rot*, *Phoma*, *Peronospora*.

(c) In *wood-working*: (1) A rotary chisel-edged cutter fastened to a cutter-head, or one of a gang of cutters so attached, used to cut away superfluous wood in shaping irregular forms, as in the manufacture of hames for harness, of felices for wagon-wheels, of curved chair-legs, etc. (2) A solid steel tool having rotating cutting edges, in the nature of a burring-tool or router, used in carving-machines for cutting ornamental figures in intaglio. In working upon wood with rotary cutters, the cutter-head shafts or cutter-spindles are sometimes carried by movable bearings, and guided after the manner of a tracing-point or stylus in a pantograph. In other machines the bearings of the cutter-head shafts or spindles are stationary, and the work is itself guided and moved to produce the required shape or pattern. See *curl*, 4 (c), and *router*. Compare also *shaper* and *shaping-machine*.—**Rotary fan, in pneumatic engine**, a blowing-machine consisting of a rotary shaft with vanes or fans that rotate in a case to which the shaft-bearings are usually attached, the air entering the case through central annular openings around the shaft, and being driven by centrifugal force against the inside periphery of the case, whence it issues under pressure corresponding with the centrifugal force generated, and for any given diameter of the fan-wheel depending upon the velocity of rotation. Also called *fan-blower*, *fan-wheel*, or simply *fan*.—**Rotary gatherer, in printing**, a revolving circular table on which the sections of a book are put, and successively brought to the gatherer. [Eng.]—**Rotary-hearth oven, rotary oven.** See *oven*.—**Rotary press, rotary machine, in printing**, a printing-press or -machine in which the types or plates to be printed are fastened upon a rotating cylinder, and are impressed on a continuous roll of paper. Such valves were used in the earliest forms of steam-engines to which automatic valve-gear was applied, and are now used in the automatic valve-gear of some of the finest variable cut-off engines. (See *steam-engine* and *valve-gear*.) When a single rotary valve is used both for induction and for education, and actuated by an eccentric rod connected with a rocker-arm rigidly attached to the body of the valve, the principles of this valve-motion are precisely the same as those of the common slide-valve motion, the point of cut-off depending upon angular advance of the eccentric and lap, and the admission being influenced by lead as in the slide-valve. Also called *rock-valve*. See *slide-valve*, cut-off, *angular advance* (under *angular*), *lap*, 3, and *lead*, 8. (b) A valve which makes complete and successive revolutions, thus alternately bringing its port or ports

rotation (rō-tā'shon), *n.* [= F. *rotation* = Sp. *rotacion* = Pg. *rotação* = It. *rotazione*, < L. *rotatio* (-n-), < *rotare*, pp. *rotatus*, rotate: see *rotate*.] 1. The act of rotating or turning, or the state of being whirled round; the continuous motion of a solid body, as a wheel or sphere, about an axis, its opposite sides moving relatively to one another, as distinguished from the forward motion of the whole body in a circle or an ellipse independent of any relative motion of its parts, as that of the planets. Thus, the daily turning of the earth on its axis is a rotation; its annual motion round the sun is a revolution.

In rotations a little force toward the circumference is equal to a greater force towards the centre.

cells, as in *Chara* and *Vallisneria*. See below.—3. Serial or recurrent order; a round or sequence of one after another; a fixed or definite routine of succession; regularly recurring change.

I have often observed particular words and phrases come much into vogue. . . . This has lately been remarkable of the word *rotation*. . . . Nothing is done now but by *rotation*. . . . (In) whilst they play the rubbers by *rotation*; a fine lady returns her visits by *rotation*; and the parson of our parish declared yesterday that . . . he, his curate, the lecturer, and now and then a friend, would for the future preach by *rotation*.
British Mag., 1763, p. 542, quoted in N. and Q., 7th ser., [VII. 164.]

Angular velocity of rotation. When a solid body revolves about an axis, its different particles move with a velocity proportional to their respective distances from the axis, and the velocity of the particle whose distance from the axis is unity is the angular velocity of rotation. It is often expressed as in turns per second.—

Axial rotation. See *axial*.—**Axis of rotation.** See *axial*.—**Center of rotation,** the point about which a body revolves. It is the same as the center of motion.—**Center of spontaneous rotation,** the point about which a body all whose parts are at liberty to move, and which has been struck in a direction not passing through its center of gravity, begins to turn. If any force is impressed upon a body or system of bodies in free space, and not in a direction passing through the center of gravity of the body or system, a rotatory motion will ensue about an axis passing through the center of gravity, and the center about which this motion is performed is called the *center of spontaneous rotation*.—**Circular rotation of the eyeball,** rotation about the visual axis.—**Congruency of rotations.** See *congruency*.—**Couple of rotations.** See *couple*.—**Energy of rotation.** See *energy*.—**Magnetic rotation of currents.** See *magnetic*.—**Magnetic rotation of the plane of polarization.** See *magnetic rotatory polarization*, under *rotation*.—**Method of rotations,** a method used in descriptive geometry, consisting in turning a part of the given geometrical system about an axis, usually perpendicular to a plane of projection.—

Principal axes of rotation. If a point which is not the center of gravity be taken in a solid body, all the axes which pass through that point (and they may be infinite in number) will have different moments of inertia, and there must exist one in which the moment is a maximum, and another in which it is a minimum. Those axes in respect of which the moment of inertia is a maximum or minimum are called the *principal axes of rotation*. In every body, however irregular, there are three principal axes of rotation, at right angles to each other, on any one of which, when the body revolves, the opposite centrifugal forces counterbalance each other, and hence the rotation becomes permanent.—**Principle of the composition of rotations,** the proposition that three rotations about axes which meet in one point are equivalent to one rotation round an axis through the same point, the measure of the rotations being taken upon the axes, and the axis of the resultant rotation being the diagonal of the parallelepiped of which the others are sides.—**Pure rotation,** rotation without translation; a screw-motion where the pitch of the screw vanishes.—**Rotation in office,** the holding of the same office by different persons in succession; specifically, in *politics*, the transfer of offices, especially those filled by appointment, to new incumbents at more or less regular intervals, without regard to the manner in which their duties have been discharged. In the United States the principle of rotation in appointive offices has been both advocated and condemned with great urgency on grounds of public advantage and partisan or personal right.

Jefferson would have *rotation in office*.
Theodore Parker, *Historic Americans*, p. 260.

Rotation of crops, a recurring series of different crops grown on the same ground; the order of recurrence in cropping. It is found that the same kind of crop cannot be advantageously cultivated on the same soil through a succession of years, and hence one kind of crop is made to succeed another in repeated series. Different soils and climates require different systems of rotation, but it is a recognized rule in all cases that culmiferous crops ripening their seeds should not be repeated without the intervention of pulse, roots, herbage, or fallow.—**Rotation of protoplasm,** in *bot.*, the circulation or streaming movement of the protoplasmic contents of active vegetable cells. Under a moderately high power of the microscope the protoplasm of vitally active cells is seen to be in a state of constant activity or rotation—that is, it flows or moves about in steady streams or bands in various directions inside the cell. These moving protoplasmic bands have embedded in them minute granules. The rate of the movements varies in different plants, being (at a temperature of 15° C.) only .009 millimeter per minute in the leaf-cells of *Potamogeton crispus*, and 10 millimeters per minute in the plasmodium of *Didymium Serpula*. See *protoplasm*.—**Rotation of the plane of polarization.** See *rotatory polarization*, under *rotation*.

rotational (rō-tā'shon-əl), *a.* [*< rotation + -al.*] Pertaining to or consisting in rotation; of the nature of rotation: as, *rotational velocity*.

We should thus be led to find an atom, not in the *rotational* motion of a vortex-ring, but in *irrotational* motion round a re-entering channel.

W. K. Clifford, *Lects.*, I. 242.

Rotational motion of a fluid. See *vortex-motion*.
rotation-area (rō-tā'shon-ā-rē-ā), *n.* Double the sum of the products obtained by multiplying each element of mass of a material system by the differential coefficient relative to the time of the area described by the radius vector upon the plane perpendicular to the axis of rotation. If all the external forces which act upon a system are directed toward an axis, the rotation-area for that axis will be described with a uniform motion, which is the principle of the conservation of areas.

The *rotation-area* for an axis may be exhibited geometrically by a portion of the axis which is taken proportional to the area, and it is evident from the theory of projections that *rotation-areas* for different axes may be combined by the same laws with which forces applied to a point and rotations are combined, so that there is a corresponding parallelepiped of *rotation-areas*. There is, then, for every system, an axis of resultant *rotation-area*, with reference to which the rotation is a maximum, and the *rotation-area* for any other axis is the corresponding projection of the resultant *rotation-area*. The *rotation-area* vanishes for an axis which is perpendicular to the axis of resultant *rotation-area*.

nidae, including forms which swim or creep like
a leech, and have a forked, jointed, telescopic
foot. Hence—2. [I. c.] One of the *Rotifera*
(which see); any wheel-animalcule. Rotifers are

A Scirtopod Rotifer, *Pedalion mira* (ventral view of female, highly magnified).

found all over the world, in salt as well as fresh water,
though chiefly in the latter; they often swarm in in-
fusions with other animalcules; a few are parasitic. Many
rotifers can be desiccated and kept in a dry state for
months and still be revived by the application of moisture.

Rotifera (rō-tif'ē-rā), *n. pl.* [NL., neut. pl. of
Rotifer: see *Rotifer*.] A class of animalcules,
usually classified with or near the lowest worms,

Hydatina senta, one of the iloricatate ploimate *Rotifera*, magnified.

A, female: a, anus; b, contractile vacuole; c, water-vessels; d, ovary; e, ganglion. B, male: a, penis; b, contractile vacuole; c, testis; f, ganglion; g, setigerous pit. In both figures the conspicuous wheel or wreath and the forked foot are unmarked.

distinguished by their circles of cilia, some-
times single, sometimes double, which through
the microscope appear like revolving wheels,
whence they have been called *wheel-animalcules*
and *Rotatoria*. They are a small but well-marked
group, whose true position in the evolutionary series
is much questioned. Some of the forms have been known
for nearly two centuries, and many others have only
recently been brought to light. Being all of microscopic
size, and often appearing in infusions, the rotifers that
were known up to about 1838, the period of Ehrenberg's
researches, were considered to be protozoan, and they
were placed with some vegetable organisms in the old-
fashioned Infusoria. (See *Infusoria*, I.) Their readily dis-
cernible complex organization gave one of the reasons for
supposing that Infusorians reach a comparatively high
grade of development. Rotifers present great attractions
to the microscopist, and have been much studied; and
the organization of few of the low invertebrates is better known.
They are true metazoans, of microscopic size, bilaterally
symmetrical, usually without metameric segmentation,
always with an intestinal canal and a body-cavity or coelom,
and with an anus as well as a mouth (except in one group).
Head and tail are generally well marked; the former bears,
under many modifications, the characteristic wheel-organ
which gives name to the group, and is technically called
the *trochal disk* (see cut under *trochal*); the tail or foot-
body, called *pseudopodium*, is variously modified as a loco-
matory organ for swimming, skipping, creeping, or root-

ing (see *pseudopodium*, 2, and cut under *Rotifer*); in a few
genera it is wanting. The body is covered with a firm
cuticle, and sometimes also sheathed in a protective case
(see *urocoelus*); it often presents peculiar spinose or setose
appendages. The muscular system may be quite highly
developed, as in *Pedalion*, where it consists of several
symmetrically disposed bands. In the alimentary canal
may usually be distinguished a mouth, pharynx, esopha-
gus, stomach, intestine, and anus. The pharynx contains
the *mastax* with its teeth or *trophæ*, among which are
parts called *malleus*, *incus*, *uncus*, *fulcrum*, *ramus*, and
manubrium (see these names, and cut under *uncus*). All
true rotifers have a mastax; its homologies are disputed.
Both the pharynx and the esophagus are chitinated. The
intestine is lined with ciliated epithelium. Nephridia are
present; a nervous system is demonstrable; and various
sense-organs, as eye-spots, are recognized. Rotifers were
supposed to be hermaphroditic; but separation of sex has
been determined for most members of the class, the males
being in all such cases small and degenerate in comparison
with the females. Details of the reproductive process
vary in different cases. The classification of *Rotifera*, as
well as the taxonomic rank and systematic position of the
group, is not yet settled, as some equivocal or aberrant
forms remain to be accounted for. Exclusive of these, a
reclassification given by C. T. Hudson in 1884, and gen-
erally accepted, is into four orders: (1) *Rhizota*, rooted
rotifers, with families *Flocculariidae* and *Melicertidae*; (2)
Bdelloida (or *Bdelligrada*), creeping rotifers, with one fam-
ily, called *Philodinidae*, though containing the original ge-
nus *Rotifer*; (3) *Scirtopoda*, skipping rotifers, the *Peda-*
lionidae, with one genus (see cut under *Rotifer*); and (4) *Ploi-*
ma, or swimming rotifers, the rest of the class. These are
either iloricatate (the *Hydatinidae*, *Synchaetidae*, *Notomma-*
tidae, *Triarthride*, and *Asplanchnidae*) or loricate (the
Brachionidae, *Pterodinae*, and *Euchlanidae*). Ranked as
a superclass or phylum, the rotifers have also been divided
into two classes: *Parapodiata*, represented alone by the
genus *Pedalion*; and *Lipopoda*, all the rest. One of the
commonest rotifers is *Hydatina senta*, belonging to the il-
loricatate ploimate group.

Rottbællia (rot-bel'i-ä), *n.* [NL. (Linnaeus filius, 1779), named after C. F. Rottball (1727-1797), professor of botany at Copenhagen, author of botanical works.] A genus of grasses, of the series *Panicaceæ* and tribe *Andropogoneæ*, type of the subtribe *Rottbællieæ*. It is marked by spikelets spiked in pairs, one of each pair sterile and pedicelled, the other fertile and sessile, and, further, by the cylindrical form of the spike, by the spikelets being embedded in excavations of the axis, by the absence of long hairs or awns, and by the single unisexual flower which commonly forms the fertile spikelet, containing four obtuse glumes, three stamens, and two distinct styles. The 27 species inhabit warm or temperate regions in both hemispheres; one species, *R. rugosa*, is found in pine-barrens from Delaware southward. They are generally tall grasses with flat leaves, either rough or smooth. Some species bear a cluster of spikes, others a single one, or, as in *R. digitata*, a handsome Asiatic species, an elongated spike is sometimes set with a few short branches at its base, with often an additional male flower in each spikelet. Some are forage-grasses, as the tropical *R. compressa*, valued by graziers in Australia.

The moth is popularly known as the *regal* *walnut-moth*.—*Royal* *household*, the body of persons employed about the court or in the personal service of a reigning king or queen. In former times the royal household included all the chief officers of state, who were regarded as merely the king's servants, and often performed menial duties toward him; afterward, only persons who had special functions relating to the royal needs, dignity, or prerogatives. In the British royal household, as it has existed for several centuries, the chief officers are the lord steward, lord chamberlain, and master of the horse, who are always peers and members of the government of the time. Under each of them are many subordinate officers, among whom the different branches of their duty are distributed. Independent of them are the private secretary and the keeper of the privy purse to the sovereign, modern additions to the household, with their subordinates. When there is a queen consort, the queen's household is a separate establishment, similarly though less elaborately organized. On the accession of Queen Victoria the expenses of the royal household were permanently fixed at £303,760 per annum.—*Royal* *letter*. See *letter*, 3.—*Royal* *marines*. See *porcelain*.—*The* *royal* *doors* or *gates*. See *door*.—*Syn.* *Royal*, *Regal*, *Kingly*. *Regal* is applicable primarily to what pertains to a king in virtue of his office, and hence to what is proper to or suggestive of a king, and as now frequently used is nearly synonymous with *princely*, *magnificent*: as, *regal* state or pomp; *regal* power. *Royal* notes what pertains to the king as an individual, or is associated with his person: as, his *royal* highness (applied to a prince of the blood); the *royal* family; the *royal* presence; the *royal* robes; a *royal* salute. It does not, like *regal*, necessarily imply magnificence. Thus, a *royal* residence may not be *regal* in its character, while on the other hand any magnificent mansion belonging to a subject may be described as *regal*, though it is not *royal*. The sway of a great Highland chief of old was *regal*, but not *royal*. Hence, in figurative use, *royal* is applied to qualities, actions, or things which are conceived of as superlatively great, noble, or admirable in themselves, or as worthy of a king: as, a *royal* disposition, *royal* virtues, a *royal* entertainment, etc.; *regal*, to those which make an impression of the highest grandeur, stateliness, ascendancy, or the like: as, a *regal* bearing, *regal* munificence, *regal* commands, etc. *Kingly* seems to be intermediate. It signifies literally like a king, hence proper to or befitting a king, and in its more general use resembling or suggestive of a king. Like *royal*, it has reference to personal qualities: as, a *kingly* bearing, presence, disposition, and the like; while, like *regal*, it is not restricted to the monarch or members of his house.—3. Imperial, august, majestic, superb, splendid, magnificent, illustrious.

It is further characterized by the absence of an involucre from the flowers, by a roundish calyx without border, a wheel-shaped corolla, five stamens, a minute disk, and an ovary commonly two-celled and two-ovuled, forming a small fleshy twin fruit. There are about 38 species, natives of the Mediterranean region, tropical and temperate Asia, South Africa, and tropical and temperate South America. They are herbs with elongated angled stems, which are commonly rigid or minutely prickly, and with large thickened roots sometimes 3 feet long. They bear whorled lanceolate or obovate leaves, usually four at a node, and small flowers in axillary or terminal cymes, with their pedicels each jointed under the calyx. See madder¹ and munjet.

The flowers are commonly perfect, regular, and symmetrical, the corolla most frequently salverform or wheel-shaped, often funnelform or bell shaped, usually with equal valvate lobes; the stamens borne upon the corolla-tube, of the same number as its lobes and alternate with them, the anthers two-celled and usually oblong-linear; the ovary, which is crowned with a disk, one- to ten-celled, with one or more, commonly very numerous, ovules in each cell. The fruit is from one- to ten-celled, capsular or fleshy, or separating into nutlets, the seeds with fleshy or corneous albumen. The order is one of the largest among flowering plants, containing about 4,500 species of 373 genera and 25 tribes, and surpassed only by the *Compositæ*, *Leguminosæ*, and *Orchidææ*. The most important tribes are *Cinchonææ*, *Naucleææ*, *Rondeletieæ*, *Hedyotideæ*, *Mussaendeæ*, *Gardenieæ*, *Ixoreæ*, *Morindeæ*, *Psychotrieæ*, *Pedericeæ*, *Spermacoceæ*, and *Galiceæ*. The species are more abundant in America, and are all tropical except two tribes, the *Galiceæ* of the northern and the *Anthospermeæ* of the southern hemisphere. They are trees, shrubs, or herbs, and exhibit great variety of habit, being either erect, prostrate, or climbing, and sometimes thorny, but have remarkable uniformity of leaf-structure, varying from the entire- and opposite-leaved type in but very few cases. Stipules are well-nigh universal, and very various, being inter- or intra-petiolar, simple or two-cleft or -divided, free or united with the petiole, etc.; in the tribe *Galiceæ* resembling the leaves, and with them making out a whorl. The flowers are very often dimorphic or trimorphic in the length of their stamens and pistils; and in some genera they are capitately disposed, giving rise to a syncarpous fruit through the union of their calyxes. Some genera—as *Bourardia* and *Gardenia*—contain ornamental plants, and several supply important products, *Coffea* yielding coffee, and *Cinchona* the cinchona-bark; while *Rubia* (the type) contains the madder-plant, whence the order is often called the madder family.

rubidium (rö-bid'i-um), *n.* [NL., *< L. rubidus*, red, reddish, *< rubere*, be red: see *ruby*]. Chemical symbol, Rb; atomic weight, 85.25. A metal belonging to the group of elements which includes lithium, sodium, potassium, and cesium: so named from the reddish tint of its salts.

It is very soft, is silver-white in color, has a specific gravity of 1.52, and melts at about 101° F. When thrown into water it burns, forming rubidium hydrate, RbOH. Rubidium was first detected by the spectroscopist, together with cesium, in the mineral water of Durkheim, in which it exists to the amount of two parts in ten million. It has since been found in considerable quantity, together with cesium and lithium, in several other saline waters, and most abundantly in that of Bourlonne-les-Bains in France. It is also found in several lepidolites: that of Rozema, in Moravia, contains 0.24 per cent. of rubidium, with only a trace of cesium; that of Hebron, in the State of Maine, 0.24 per cent. of rubidium and 0.3 per cent. of cesium. The two metals likewise occur, though in smaller quantity, in the lepidolite of Prague, the petalite of Uto in Finland, the lithia-mica of Zinnwald in the Erzgebirge, and other lithia minerals. It has been found also in the ashes of many plants, and in the saline or crude potash obtained from the residue of the beet-sugar manufacture. It has been found in tobacco-leaves, and in coffee, tea, cocoa, and crude tar.

In minerals and mineral waters rubidium and cesium are always associated with lithium, and generally also with potassium and sodium; but plants have the power of assimilating two or three of these metals to the exclusion of the rest; thus, tea, coffee, and the saline of beet-root contain potassium, sodium, and rubidium, but not a trace of lithium.

Organs, however little developed, if of use, should not be considered as rudimentary; they may be called nascent, and may hereafter be developed by natural selection to any further extent.

Darwin, Origin of Species, p. 406.

= Syn. 3. *Rudimentary*, *Vestigial*, *Abortive*. These three words, in their biological application, are commonly used interchangeably, and may mean exactly the same thing. But there is a clear and proper distinction in most cases, since that which is rudimentary in one organism may be fully developed in another organism, and that which is rudimentary in a given organism may or may not proceed to develop in that organism. So that which is developed in one organism but remains rudimentary in another is vestigial for the latter—that is, it affords a mere trace or hint of the former; and that which might have developed but did not develop in the same organism is abortive. Thus, all embryonic parts and organs are properly rudimentary; all functionless organs are vestigial which in another case have become functional; those which are normally functional but fail to become so in a given case are abortive. Rudimentary is the most general and comprehensive term for that which is rude, raw, crude, unformed, in an absolute sense: vestigial is a relative term, implying comparison with something else, of which that which is vestigial is a mere trace; abortive is likewise a relative term, but one implying arrest or failure of development in the thing itself, without reference to any other thing. Few if any organs can be described with equal accuracy by all three terms, though the distinctions are often ignored. Vestigial is a more technical term than either of the other two, implying a broad view of the thing described, derived from comparative anatomy and physiology, according to the theory of evolution. Abortive is specially applicable to pathological and teratological cases. A harelip or cleft palate is abortive, but neither vestigial nor rudimentary. The thymus of the adult is vestigial, but neither abortive nor rudimentary. The brain-bladders of the embryo are rudimentary, but neither vestigial nor abortive. Most of the functionless and apparently useless organs of adults of the higher animals are most properly to be designated as vestigial.

The flowers are greenish-yellow and corymbed, and are produced all summer. The plant has a strong disagreeable odor, and the leaves are extremely acrid, even producing blisters. It has the properties of a stimulant and antispasmodic, but accompanied by excitant and irritant tendencies. It is not now official, but continues somewhat in popular use. In medieval folk-lore it was a common witches' drug. From its supposed virtues, or by association with the word *rue*, repentance, it was formerly called *herb-of-grace*.

In this sense some rules are *statutory* or *constitutional*—that is, created by or embodied in statutes or a constitution; some are *common-law rules*, as many of the rules of evidence; and some are *equitable*—that is, introduced by the courts of equity. (2) More specifically, regulations (generally, if not always, promulgated in writing) prescribed by a court or judges for the conduct of litigation, being either *general rules*, applicable to whole classes of cases (commonly called *rules of court*), or *particular rules*, or orders in particular cases: as, a *rule* for a new trial, a *rule nisi*, etc. (c) *pl.* In American parliamentary law, the regulations adopted by a deliberative body for the conduct of its proceedings, corresponding to the standing orders of the British House of Commons. (d) In *gram.*, an established form of construction in a particular class of words, or the expression of that form in words. Thus, it is a *rule* in English that *s* or *es* added to a noun in the singular number forms the plural of that noun; but *man* forms its plural *men*, and so is an exception to the *rule*.

See *antepredicament*.—**A rule to show cause**, or *rule nisi*, a rule which is conditional, so that, unless the party against whom it has been obtained shows sufficient cause to the contrary, it will become absolute.—**As a rule**, as a general thing; on the whole.—**Bevel plumb-rule**, an instrument used by engineers in testing the slope of an embankment. One limb of it can be set to any angle with the other, which is held plumb, to determine whether the slope has the proper angle or not.—**Brass rule**. See def. 8.—**Cardan's rule**, a rule for the solution of cubic equations, first published by Jerome Cardan, to whom it had been confidentially communicated by the Italian mathematician Tartaglia (died 1559). But the first discoverer is said to have been Scipione dal Toso (died about 1525). The rule is that the solution of the equation $x^3 + px + q = 0$ is

$$x = \sqrt[3]{-q + \sqrt{q^2 + 4p^3}} + \sqrt[3]{-q - \sqrt{q^2 + 4p^3}}$$

The rule is applicable in all cases; but if there are three real roots, it is not convenient, on account of imaginaries.

—**Carpenter's rule**, in the common form, a two-foot rule, folding in four, graduated to eighths and sixteenths of an inch. Sometimes a pivoted index with a scale or a graduated slider is added to adapt the instrument for a greater number of uses and to aid in making certain computations.—**Cross-rule paper**. See *paper*.—**De Gua's rule** [named after the French mathematician Jean Paul de Gua de Malves, who gave it in 1741], the proposition that if any even number of successive terms is wanting from an equation there are as many imaginary roots, and if any odd number of terms is wanting there are one more or one less imaginary roots according as the two terms adjoining the gap have like or unlike signs.—**Descartes's rule of signs**, otherwise called *Descartes's theorem*, the proposition that in a numerical algebraic equation the number of positive roots cannot surpass the number of variations in the series of signs of the successive terms after these have all been brought to the same side of the equation and arranged according to the powers of the unknown quantity; and, further, that the excess of the number of variations over the number of positive roots cannot be an odd number.—**Dotted rule**. See def. 8.—**Double rule**. See def. 8.—**Figure of the golden rule**, a line shaped like a Z, with the terms of a proposition at its ends and angles, thus:

as 4 — is to — 12

so 18 — is to — 54.

—**Gag-rule**. Same as *gag-law*.

The Century, XXXVII. 875.

Gauss's Rule for finding the date of Easter. See *Easter*.—**Golden rule.** See *golden*.—**Guldin's rule**, one of two rules, one giving the volume and the other the surface of any ring formed by the revolution of any plane closed curve about an axis lying in its plane. The rules are named after the Swiss mathematician Paul Guldin (1577–1643), but he obtained them from the collections of Pappus, a geometer of the fourth century.—**Home rule.** See *home*.—**Home-Rule Bill.** See *bill*.—**Inverse rule of three.** See *inverse*.—**Joint rule**, a rule adopted by both houses of Congress or a legislature for the conduct of transactions between them.—**Labor-saving rule**, in printing, brass rules cut by system to graduated lengths, so that they may be easily combined.—**Minding's rule**, a rule for the determination of the degree of an equation resulting from elimination, given by the Prussian mathematician E. F. A. Minding in 1841.—**Napier's rule**, one of two mnemonic rules given by Napier, the inventor of logarithms, for the solution of right-angled spherical triangles. The two legs and the complements of the hypotenuse and of the angles are called the *parts*. An angle and one of the sides going to form it are said to be *adjacent*; so, also, are the two legs. A part adjacent to both or neither of two parts is called, relatively to them, the *middle part*; and if the other two are not adjacent to it, they are called *opposite*. Then, the two rules are that the sine of the middle part is equal to the product of the tangents of the adjacent parts and to the product of the cosines of the opposite parts. These are equivalent to six equations of different forms.—**Newton's rule**, a certain rule for determining a superior limit to the number of positive roots of an algebraic equation, and another for the negative roots. Let the equation be

$$ax^n + na_1x^{n-1} + \frac{n(n-1)}{1.2} a_2x^{n-2} + \text{etc.} = 0.$$

Form a series of quantities A, A_1, \dots, A_n , by the formula $A_r = a^2r - a_{r-1}a_{r+1}$. Write down the two rows

$$\begin{matrix} A, & A_1, & A_2, & \dots, & A_n \\ A_1, & A_2, & A_3, & \dots, & A_n \end{matrix}$$

If two successive numbers in the upper row have like signs while the numbers under them also have like signs, this is called a *double permanence*. But if two successive numbers in the upper row have different signs while the numbers under them have like signs, this is called a *variation-permanence*. The rule is that the number of negative roots cannot be greater than the number of double permanences, nor the number of positive roots greater than the number of variation-permanences.—**One-hour rule**, a standing rule of the United States House of Representatives, first adopted in 1847, in accordance with which no member, except one who reports a measure from a committee, may, without unanimous consent or permission given by vote, speak for more than one hour in debate on any subject.—**Parallel rule**. (a) A rule for drawing parallel lines. The old form of parallel rule consisted of two rulers connected by two bars turning upon pivots at the vertices of a parallelogram. For accurate work, a triangle and a straight-edge are used. (b) See def. 8.—**Rule day**, in legal proceedings, motion day; the regularly appointed day on which to make orders to show cause returnable.—**Rule of cosset**. See *cosset*.—**Rule of faith** (*regula fidei*), the sum of Christian doctrine as accepted by the orthodox church in opposition to heretical sects; the creed: a phrase used from the second century onward.—**Rule of false** (*regula falsi*), or **rule of double position**. See *position*.—**Rule of intersection, rule of six quantities**, the proposition that, if a spherical triangle be cut by a transversal great circle, the product of the chords of the doubles of three segments which do not cut one another is equal to the product of the chords of the doubles of the other three segments. This rule was discovered by Menelaus, about A. D. 100.—**Rule of mixtures**. Same as *allegation*.—**Rule of Nicomachus** [named from Nicomachus, a Greek arithmetician who flourished about A. D. 100, and who is said to have been the author of this rule], a rule for finding the square of a small number, as follows: subtract the number from 10 and to the square of the difference add 10 times the number diminished by the difference. Thus, to find the square of 9, subtract 9 from 10, which gives 1 as the difference, the square of which is 1, and adding to this 10 times the excess of the original number, 9, over the difference, 1, which excess is 8, we have 81 as the answer.—**Rule of philosophizing**, a rule for constructing theories. Newton propounded certain rules of this kind.—**Rule of signs**, the rule that any arrangement is positive or negative according as it contains an even or odd number of displacements.—**Rule of speech** (*regula sermonis*), the rule of false, so called because in the use of it we "say" a quantity has a value which is false.—**Rule of supposition**, the rule of false. See *position*.—**Rule of the double sign**, the principle that zero may be regarded either as positive or negative at pleasure, which has important applications under Budan's theorem.—**Rule of the octave**. See *octave*.—**Rule of the road**. See *road*.—**Rule of three**, the method of finding the fourth term of a proportion when three are given. The numbers being so arranged that the first is to the second as the third is to the fourth, which last is the term required to be found, then this is found by multiplying the second and third terms together, and dividing the product by the first.—**Rule of thumb**, a rule suggested by a practical rather than a scientific knowledge; in allusion to a use of the thumb in marking off measurements roughly.

We'll settle men and things by *rule of thumb*,
And reach the lingering night with ancient rum.
Sydney Smith, To Francis Jeffrey, Sept. 3, 1809.

Rule of trial and error, the rule of false. See *position*.—**Rules of a prison**, certain limits outside the walls of a prison, within which prisoners in custody were sometimes allowed to live, on giving security not to escape. The phrase is sometimes extended to mean the space so inclosed, and also the freedom thus accorded to the prisoner.

To add these, the prisoners took it in turns to perambulate the *rules*, and solicit help in money or kind.
J. Ashton, Social Life in Reign of Queen Anne, II. 247.

Both at the King's Bench and the Fleet debtors were allowed to purchase what were called the *Rules*, which en-

Rules of course, rules which are drawn up by the proper officers on the authority of the mere signature of counsel; or, in some instances, as upon a judge's fiat, or allowance by the master, etc., without any signature by counsel. It is used for measuring, and as a straight-edge to guide a knife in cutting thick paper, as drawing paper, pasteboard, etc.—**The rule in Shelley's case**, a much quoted doctrine of the common law, to the effect that wherever there is a limitation to a man which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions) either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate of the ancestor, and not as a gift to the heir.—**To buy in under the rule**. See *buy*.—**Twenty-first rule**, in U. S. hist., a rule adopted by the House of Representatives in 1840, and dropped in 1844, prescribing that no abolition petitions should be received by the House.—**Waved rule**. See def. 8.—**Syn. 2. Precept**, etc. (see *principle*), law, regulation, formula, criterion, standard.—**7. Direction**, regulation, dominion, lordship, authority, mastery, domination.

ruling-engine (rō'ling-en'jin), *n.* A machine for ruling diffraction gratings. The ruling is performed by a fine diamond-point, the spacing of the lines being accomplished by the most refined micrometer-screw mechanism. (See *grating²*, 2, and *micrometer*.) The new ruling-engine at Johns Hopkins University has produced gratings ruled with from 10,000 to 20,000 lines per inch, 6 inches in diameter, with faces formed on a radius of more than 21 feet, and having better definition than any ever before made. Such engines must be placed in as nearly equable a temperature as can be attained, as any sensible expansion or contraction during their operation defeats their purpose.

ruling-machine (rō'ling-ma-shēn'), *n.* 1. A machine used by engravers for ruling in flat tints, etc. The cutting of the lines is done by a tool with a diamond-shaped point. 2. A machine used for ruling parallel colored lines upon writing-paper, or upon paper for the manufacture of blank-books; a paper-ruler. Fountain-pens with mechanism for spacing and for drawing them simultaneously upon the surface to be ruled, or in some cases endless bands (each a fine thread passing through coloring material) arranged so that a part of each band is brought into contact with the paper to be ruled, mechanism for spacing the lines, intermittent feed for the paper, and mechanism for lifting the ruling-bands from the paper when the latter is fed forward are characteristics of such machines. In ruling columns on pages for blank-books ruling-pens are employed.

Ruminantia (rō-mi-nan'shi-jē), *n.* pl. [NL., neut. pl. of *L. ruminan(t)-s*, chewing the cud: see *ruminant*.] A series or section of artiodactyl ungulate mammals; the ruminants or ruminating animals, or hoofed quadrupeds that chew the cud. All are even-toed and cloven-footed, and have a complex stomach of several compartments, in the largest one of which food is received without being chewed, to be afterward regurgitated or thrown up into the mouth, there chewed at the animal's leisure, and then swallowed again. In nearly all living ruminants the stomach has four compartments, or is quadripartite: these are the *rumen*, *paunch*, or *plain tripe*; the *reticulum*, or *honeycomb tripe*; the *omasum*, *psalterium*, or *manyplies*; and the *abomasum* or *runner-bag*, succeeding one another in the order here given. The two former belong to the cardiac division of the stomach, the two latter to the pyloric. The families of living ruminants whose stomachs are thus perfectly quadripartite are—(1) the *Girafidæ*, or camelopards; (2) the *Sapindæ* (if regarded as distinct from the *Bovidæ*); and (3) the *Bovidæ*, or cattle, including also sheep and goats and all kinds of antelopes excepting (4) the *Antilocapridæ*; and (5) the *Cervidæ*, or deer family. In the *Camelidæ*, or camels and llamas, the stomach is imperfectly four-parted. In the *Traguidæ* it is tripartite, no psalterium being developed. Several extinct families are believed on other grounds (their stomachs being unknown) to have belonged to the *Ruminantia*. The ruminants are collectively contrasted with those ungulates which, though artiodactyl, do not ruminate, and are known as *Omnivora*, as the swine and hippopotamus. The average size of ruminants among mammals is large, a sheep being one of the smaller species; they are perfectly herbivorous, and have in addition to the pecu-

The average size of ruminants among mammals is large, a sheep being one of the smaller species; they are perfectly herbivorous, and have in addition to the pecu-

liarities of the digestive system certain characteristic dental and cranial features: thus, there are no upper incisors, except in the camel family, in any of the living ruminants, and the under incisors bite against a callous pad. At the present time these animals are found in nearly all parts of the world (not, however, in the Australian); they are comparatively poorly represented in America, and occur in the greatest numbers, both of individuals and of species, in Africa. Also called *Pecora*. See also cut under *Tragus*.

ruminatingly (rō'mi-nā-ting-li), *n.* In a ruminating manner; ruminantly.

rumination (rō'mi-nā'shon), *n.* [= F. *rumination* = Pg. *ruminação* = It. *ruminazione*, < *L. ruminatio(n)-*, chewing the cud: see *ruminate*.] 1.

The act or process of ruminating, or chewing the cud. The food of ruminants is entirely herbaceous, and consists chiefly of grass. This is rapidly cropped by grazing, and hastily swallowed, mixed with saliva. When its appetite is satisfied, the ruminant stands still, or oftener lies down, generally on its side. Then occurs a spasmodic action of the abdominal muscles and of the diaphragm, like a hiccup, which forces a bolus of grass, sodden in the fluids of the paunch, up the gullet and into the mouth, to be masticated or chewed at leisure. During this second chewing the cud is mixed with more saliva, thoroughly ground to pulp, and in this semi-fluid state it is finally swallowed. The cropped grass, when first swallowed, passes indifferently into either the rumen or the reticulum (which are in fact only two compartments of the cardiac division of the stomach, the gullet entering the stomach just at their junction), and in the ordinary peristaltic action of the stomach the fodder passes back and forth from one to the other. But there is an arrangement of muscular folds by means of which a canal may be formed that leads directly from the gullet past the rumen and reticulum into the psalterium, and by this channel the food, when returned after the rumination, may be conducted directly to the third stomach. Water drunk passes easily into any of the four stomachs according to circumstances. Neither the paunch nor the honeycomb is ever completely emptied of food; they have been found partly filled with sodden fodder in animals which have starved to death. It does not appear, as has been supposed, that the reticulum is specially concerned in modeling the boluses which are to be regurgitated. The regurgitation is effected by the reversed peristaltic action of the gullet. During the spasmodic action by which the sodden mass is driven against the opening of the gullet, and some of it forced into the gullet to be thrown up. It is prevented from passing into the psalterium partly by the narrowness of the opening between the reticulum and the psalterium, and partly by the resistance offered to the coarse mass by the close-pressed psalterial leaves or layers, which act like a fine grating. But when the mass is swallowed again in its now pulpified and semi-fluid state, and is directed to the psalterium by the conformation of the parts, it readily soaks in through the psalterial layers, and thus reaches the abomasum or fourth stomach, where it is finally chymified by the action of the gastric juice, to which it is not before subjected. Rumination in man, when it is pathological, is also called *mergism*.

2. The act of ruminating or meditating; a musing or continued thinking on a subject; meditation or reflection.

It is characterized by a sessile four- or five celled ovary, and eight or ten stamens alternately shorter, their filaments dilated at the base, and by four or five arched and toothed petals growing from a thick urn-shaped receptacle. There are about 50 species, widely scattered through the Mediterranean region and western and central Asia. They are herbs with perennial or somewhat shrubby base, dotted with glands and emitting a heavy odor. They bear alternate leaves, either simple, divided, trifoliate, or decomposed, and many-flowered terminal corymbs or panicles of yellow or greenish flowers. The general name of the species is *rue* (which see). See cut under *Oenanthe*.

rutabaga (rō-tā-bā'gā), *n.* [= F. *rutabaga*; of Sw. or Lapp. origin (?).] The Swedish turnip, a probable derivative, with the rape and common turnip, of *Brassica campestris*. It is characterized by flowers with four or five sepals and as many broadly imbricated petals, by an ovary of four or five carpels, either wholly connate or united only by their basilar or ventral styles or their stigmas, or rarely entirely free, the ovules commonly two in each cell, and usually by an annular or bowl-shaped disk within the circle of stamens. The seeds are oblong or reniform, most often sessile and solitary in the cell, often with a shining crust, with or without fleshy albumen. The order includes about 780 species, of 101 genera and 7 tribes, scattered through the warm and temperate parts of the globe, most abundant in South Africa and Australia, least frequent in tropical Africa. They are shrubs or trees, rarely herbs, dotted with glands and often exhaling a heavy odor. They bear leaves without stipules, which are usually opposite, sometimes simple, but more often compound, and of one, three, or five leaflets, or variously pinnate. The flowers are most often in axillary cymes; the fruit is very various. There are two well-marked series, of which the larger and typical, having the ovary deeply lobed and the fruit capsular, contains the tribes *Cuspariæ*, *Rutæ*, *Diosmeæ*, *Boroniæ*, and *Xanthoxyloæ*; and the smaller, having the ovary little if at all lobed, and the fruit coriaceous, drupaceous, or a berry, contains the tribes *Toddaliæ* and *Aurantieæ*. The last includes, in the genus *Citrus*, the orange and the lemon, which depart from the type in their numerous carpels, ovules, and stamens. For some of the important genera, see *Ruta* (the type), *Ptelea*, *Xanthoxylum*, *Citrus*, *Murraya*, *Peganum*, and *Dictamnus*.

It includes 6 genera, of which *Ruta* is the type. They are widely scattered through most northern temperate regions.

They are splendid metallic beetles, mostly of the warmer parts of America. The body is shorter, rounder, and more polished than is usually the case with scarabs, and the tarsi are thick, enabling the insects to cling closely to trees. One of the commonest and most beautiful species is *Areola* (*Cotalpa*) *lanigera*, the goldsmith-beetle, 3/4 inch long, of a yellow color glittering like gold on the head and thorax. They appear in New England about the middle of May. *Plusiotis gloriosa* is pale-green, with the margins of the body and broad stripes on the elytra of pure polished gold-color. Also *Rutelidæ* as a family and *Rutelini* as a tribe. See cut under *Cotalpa*.

The name was given by Osann, in 1828, to one of three supposed new metals found in platinum ores from the Ural mountains. Most of what is known of it is due to Claus, who, in 1845, proved the existence of one of Osann's new metals, and retained his name (*ruthenium*) for it, because there was really a new metal in the substance called by Osann "ruthenium oxide," although, in point of fact, this was made up chiefly of various other substances—silica, zirconia, etc. Ruthenium is found in native platinum as well as in osmiridium, and in laurite, which is a sesqui-sulphure of ruthenium, and occurs in Borneo and Oregon. It is a hard, brittle metal, fusing with more difficulty than any metal of the platinum group, with the exception of osmium. The cereal plant *Secale cereale*, or its seeds. Its nativity appears to have been in the region between the Black Sea and the Caspian. Its culture has been chiefly in the north, and, though ancient, is not of the highest antiquity. It bears more cold than any other grain, thrives on light and otherwise barren soils, and can be grown continuously on the same spot. It is most extensively produced in central and northern Europe, where it forms the almost exclusive breadstuff of large populations, furnishing the black bread of Germany and Russia, and the rye-cakes which in Sweden are baked twice in a year and preserved by drying. Rye is less nutritious than wheat, though in that respect standing next to it. The black bread has a sour taste, owing to the speedy acetous fermentation of the sugar contained in it. A sweet bread is also made from rye. The roasted grains have long been used as a substitute for coffee.

Rye enters in Russia into the national drink, kvass, in Holland into gin, and in the United States it is the source of much whisky. When affected with ergot (see *ergot*), 2, and spurred rye below) rye becomes poisonous. The young plant affords a useful green fodder; the straw is valued for thatching, for filling mattresses, for the packing of horse-collars, etc. Rye is often planted with grass-seed in the United States as a protection during the first season, and similarly with pine-seeds in the Alpine region. It has spring and fall varieties, one of the latter being known as *Wallachian*; in general it has less varieties than other much-cultivated plants. The *rie* of Exodus ix. 32 and Isaiah xxviii. 25 is probably spelt.

given for the other letters (see especially *A*), is as follows:

The Phoenician system had more than one sibilant sign, and the Greek choice wavered at first between two of them, until it settled upon this one. Of all the signs here given the value was the same—namely, our normal *s*-sound, as in *so*, *us*. This is a surd or breathed utterance, a fricative or continuant consonant, of a peculiar character, to which we give the name of *sibilant* or *hissing*. Its sonant or voiced counterpart (related to it as *d* to *t*, as *v* to *f*, and so on) is *z*, as in *zeal*, *dizzy* (the buzzing sound). They are produced between the tongue, at or near its tip, and a point on the roof of the mouth either close behind the front teeth or at a further remove from them. Probably no other of our alphabetic sounds are producible through so wide a range of (slightly) varying positions, or actually produced, in different districts and individuals, in so different a manner. None, also, are more freely combinable with other consonant-sounds into intricate groups, as in *strands*, *twelfths*, *splints*, *sixths*. In virtue of their mode of production, they are akin with *t* and *d*, and, like them, are often called dental, or lingual, or tongue-tip sounds. The proper or hissing *s* is one of the most common elements of English utterance, forming more than 4½ per cent. of it. But its sign has also other values. As *s* is one of our most used endings—for example, of plural number, of possessive case, of third person singular present—it comes extremely often at the end of a word, and there, after any sonant sound, it is pronounced as *z*: for example, *loves*, *love's*, *he loves*; *flies*, *fly's*, *he flies*; and it has the same sound often in the interior of words, especially between sonants: for example, *use*, *nose*, *dismal*. The *s*-sound, on the other hand, is represented to a considerable extent by *c* before *e*, *i*, *y* (see *C*); and by double *s*, or *ss*, which is frequent in the middle and at the end of words, and has the hissing sound, save in a few exceptional cases, like *dis-solve*, *pos-sess* (between the *o* and *e*). Another sound often represented by *s* is the *sh*-sound (see below)—namely, in very numerous cases where the *s* is followed by a consonantal *y*-sound, whether written with *i*, as in *passion*, or implied in “long *u*,” as in *sure*, *flavour*: since the combination *sy* in English pronunciation has a strong tendency to fuse into *sh*, and in ordinary free utterance often does so, even in cases where theory and extra-careful usage require the separation of the two sounds. This fused sound is represented by the important digraph *sh* (also by *ch* in a few French words, as *machine*). It is a second sibilant, a more palatal one—as simple an utterance as the *s*-sibilant, but very much less frequent (less than 1 per cent., or one fifth of *s*; but about ½ per cent. if its presence in the *ch*-sound is included). It is made with nearly the same part of the tongue as *s*, and against the roof of the mouth, but generally a little further back, and especially (it would seem) with an open cavity immediately behind the point of closest approximation of the organs. Its compound sign (Middle English and German *sch*) marks it as coming historically from the fusion of an *s* with a following guttural spirant. It has a rare sonant counterpart in the *zh*-sound of *azure*, *pleasure*, and the like (as to which, see *Z*). The *sh*- and *zh*-sounds also constitute the concluding element in the compound *ch*- and *j*- or soft *g*-sounds (see *ch* and *G* and *J*) combined with a somewhat modified *t* and *d* respectively (made by a contact at the *sh*-point) as first element.

a lens). (i) [*l. c.*] In *her.*, of *sable*. (j) In *meteor.*, of *stratus*. (k) In musical notation (1), of *senza*; (2) in the form *:S*, of *segno* (see *D. S.* and *segno*).—5. An operative symbol in quaternions, signifying the operation of taking the scalar part of a quaternion. It is also used in algebra for certain varieties of summation. The lower-case *s* usually denotes space, or the length of the arc of a curve. An *s* below the line, in enumerative geometry, refers to a plane pencil of rays. Σ (Greek *S*) signifies the sum of successive values of a function; the variable which is to take successive integral values in the terms to be added may be written below the line after the Σ , and the lower and upper limit of the summation may be written below and above the Σ . Thus,

$$a^x = \sum_{n=0}^{\infty} \frac{1}{n!} (\log x)^n.$$

In the calculus of finite differences Σ is used like a sign of indefinite integration, the lower limit being replaced by an arbitrary constant, while the upper is supposed to be 1 less than the value of the variable. Thus, $\Sigma Fz = F(x-1) + F(x-2) + \text{etc.}$, down to a constant value of the variable, and then an arbitrary constant is to be added to the series. σ is used in the integral calculus to denote the area of a surface. A modified long *s*, *f*, is the sign of integration.—**Light green S.** Same as *acid-green*.—**Magenta S.**, **rubine S.** Same as *acid-magenta*.

Sabal (sä'bal), *n.* [NL. (Adanson, 1763); said to be from a S. Amer. or Mex. name.] A genus of fan-palms of the tribe *Corypheæ*, including several palmettos. It is distinguished from the genera next akin, *Washingtonia* and *Corypha*, by its dorsal embryo, and is further characterized by bisexual flowers with a cup-shaped calyx and a deep-lobed imbricate corolla persistent unchanged after blossoming, by its six united stamens forming at their dilated bases a ring attached to the corolla-tube, and by its three-lobed and three-celled ovary, tapering into a robust columnar style which is basilar in fruit. The fruit is usually globose and one-celled, with a loose fleshy pericarp, and a single shining dark-brown roundish and depressed seed, with hard corneous albumen which is deeply hollowed in at the base. The 7 species are natives of tropical America, from Venezuela and Trinidad northward into Florida and South Carolina and the Bermuda Islands. They are thornless palms, some species low and almost stemless, others with a tall robust trunk ringed at the base and covered above with the remains of sheaths. The leaves are terminal, roundish, and deep-cleft; the flowers are small and smooth, white or greenish, and the fruit is small and black, borne on a large and elongated spadix which is at first erect, and inclosed in a long tubular spathe, from which hang many long and slender branches and branchlets. Sabbatarian (sab-a-tä'ri-an), *a.* and *n.* [*L. sabbatarius* (> *Sp. sabbatario* = *Fg. sabbatario* = *F. sabbataire*), of or belonging to the Sabbath (*sabbatarii*, *pl.*, the Sabbath-keepers, i. e. the Jews), < *sabbatum*, Sabbath: see *Sabbath*.] 1. *a.* Pertaining to the Sabbath or its observance.

II. *n.* One who maintains the observance of the Sabbath (in the original sense) as obligatory on Christians. Hence—(a) One who observes the seventh day of the week as the Sabbath, as the Jews do, instead of the first (Sunday), as do Christians generally. A denomination of Baptists are called *Sabbatarians*, or *Seventh-day Baptists*, because they maintain that the Jewish Sabbath has not been abrogated. The Seventh-day Adventists hold the same view.

And because some few *sabbatarians* among ourselves do keep the old sabbath only, and call still for Scripture proof for the institution of the Lord's day, let me briefly tell them that which is enough to evince their error.

Baxter, Life of Faith, II. 7.

(b) One who observes the Sabbath (whether Saturday or Sunday) according to the real or supposed Jewish rules for its observance; hence, one who observes it with more than the usual strictness. In the Puritan controversies of the sixteenth century the church party maintained that the obligation to observe one day in seven as a day of rest and devotion rested not upon the fourth commandment, but upon church usage and the beneficent results arising therefrom; the Puritans maintained that the obligation was based upon the Jewish law, and that the nature of the obligation was to be deduced from the Jewish regulations. They interdicted every sort of worldly occupation and every form of pastime and recreation, and were termed *Sabbatarians* by their opponents; hence the later use of the term as one of reproach.

We have myriads of examples in this kinde amongst those rigid *Sabbatarians*. *Burton*, *Anat. of Mel.*, p. 680.

We left Lillehammer on a heavenly Sabbath morning. . . . Rigid *Sabbatarians* may be shocked at our travelling on that day: but there were few hearts in all the churches of Christendom whose hymns of praise were more sincere and devout than ours. *B. Taylor*, Northern Travel, p. 264.

Sabbatarianism (sab-a-tā'ri-an-izm), *n.* [*< Sabbatharian + -ism.*] The tenets or practices of the Sabbatarians.

Sabbath (sab'ath), *n.* and *a.* [Also dial. (or archaically in def. 5) *Sabbat*; *< ME. sabat, sabbat, sabot, sabote, rarely saboth, < AS. sabat = D. sabbath = MHG. sabbatus, sabbato, G. sabbat = Sw. Saturday, < Heb. shabbāth, rest, sabbath, sabbath day, < shabbāth, rest from labor. Milton, P. L., viii. 246.

The Christian festival [Sunday] was carefully distinguished from the Jewish *Sabbath*, with which it never appears to have been confounded till the close of the sixteenth century.

Lecky, Europ. Morals, II. 258.

2. The first day of the week, similarly observed by most Christian denominations: more properly designated *Sunday, or the Lord's Day*. The seventh day of the week, appointed by the fourth commandment, is still commonly observed by the Jews and by some Christian denominations. (See *Sabbatarian*.) But the resurrection of the Lord on the first day of the week, being observed as a holy festival by the early church, soon supplanted the seventh day, though no definite law, either divine or ecclesiastical, directed the change. A wide difference of opinion exists among divines as regards both the grounds and the nature of this observance. On the one hand it is maintained that the obligation of Sabbath observance rests upon positive law as embodied in the fourth commandment; that the institution, though not the original day, is of perpetual obligation; that the day, but not the nature of its requirements, was providentially changed by the resurrection of Jesus Christ and the consequent action of the Christian church; and that, to determine what is the nature of the obligations of the day, we must go back to the original commandment and the additional Jewish laws. This may be termed the Puritan view, and it defines thus the nature of the Sabbath obligation: "This Sabbath is then kept holy unto the Lord, when men, after a due preparing of their hearts, and ordering of their common affairs beforehand, do not only observe an holy rest all the day from their own works, words, and thoughts about their worldly employments and recreations; but also are taken up the whole time in the public and private exercises of His worship, and in the duties of necessity and mercy." (*West. Conf. of Faith, xxi. § 8.*) The other view is that the fourth commandment is, strictly speaking, a part of the Jewish law, and not of perpetual obligation, though valuable as a guide to the Christian church; that this commandment, like the rest of the Jewish ceremonial law, is abrogated in the letter by Christ; and that the obligation of the observance of one day in seven as a day of rest and devotion rests upon the resurrection of the Lord, the usage of the church, the apostolic practice, and the blessing of God which has evidently followed such observance. This is the view of the Roman Catholic Church, of the Greek Church, of many Anglicans, and of others, including the Protestants of the European continent. It naturally involves a much less strict regulation of the day. Between these two opinions there are a variety of views, the more common one probably being that the obligation to observe one day in seven as a day of holy rest is grounded upon the fourth commandment and is of perpetual obligation, but that the day to be observed and the nature of the observance are left to the determination of the Christian church in the exercise of a Christian liberty and discretion. Other terms for the Sabbath are *Sunday, the Lord's Day, and First-day*. *Sabbath* designates the institution as well as the day, and is still in vogue in Jewish and Puritan usage and literature, but properly indicates an obligation based upon the fourth commandment and a continuance of the Jewish observance. *Sunday* (the Sun's day) is originally the title of a pagan holiday which the Christian holiday supplanted, and is the common designation of the day. *The Lord's Day* (the day of the Lord's resurrection) is of Christian origin, but is chiefly confined to ecclesiastical circles and religious literature. *First-day* is the title employed by the Friends to designate the day, their object being to avoid both pagan and Jewish titles.

The *Sabbath* he [Mr. Cotton] began the evening before; for which keeping of the *Sabbath*, from evening to evening, he wrote arguments before his coming to New England; and I suppose 'twas from his reason and practice that the Christians of New-England have generally done so too.

C. Mather, Mag. Chris., III. 1.

There were as many people as are usually collected at a muster, or on similar occasions, lounging about, without any apparent enjoyment; but the observation of this

may serve me to make a sketch of the mode of spending the *Sabbath* by the majority of unmarried, young, middling class people near a great town.

Hawthorne, Amer. Note Book, p. 18.

The Lord's Day was strictly observed as a *Sabbath*, according to the Puritan view that its observance was enjoined in the decalogue. The *Sabbath* extended from the sunset of Saturday to the sunset of Sunday, according to the Jewish method of reckoning days.

5. A midnight meeting supposed in the middle ages to have been held annually by demons, sorcerers, and witches, under the leadership of Satan, for the purpose of celebrating their orgies. More fully called *Witches' Sabbath*. Also, archaically, *Sabbat*.

Pomponaccio points out that part of the functions of the *Witches' Sabbath* consisted in dancing round a goat, a remnant of the worship of Pan, and that it is in memory of this that the wearing and setting up in the house of a horn as a counter charm is common in Italy.

The Atlantic, LVIII. 467.

Great Sabbath, Holy Sabbath, Easter Even. The name *Great Sabbath* was given to this day in the early church. Similarly, in John xix. 31, the Sabbath before Christ's resurrection is called *great* (Authorized Version, "an high day"). Sabbatia (sa-bā'ti-ā), *n.* [NL. (Adanson, 1763), named after Liberatus *Sabbati*, an Italian botanist, who wrote a "Synopsis of the Plants of Rome" (1745).] A genus of gamopetalous

plants of the order *Gentianeæ*, tribe *Chironiææ*, and subtribe *Erythraææ*. It is characterized by flowers with from five to ten narrow calyx-lobes, a five- to twelve-lobed wheel-shaped corolla, as many stamens with short filaments inserted on its throat, their anthers erect and afterward recurved but not twisted, and a one-celled ovary with projecting placenta and a thread-shaped style and stigma, the latter with two entire and linear lobes.

The 15 species are natives of the United States, extending into Cuba. They are annual or biennial herbs, erect and unbranched or panicled above, bearing opposite sessile leaves, and white or rose-colored flowers, disposed in loose cymes. The flowers are usually numerous and handsome, marked by a small central yellow star, and in the largest species, *S. chloroides*, are about 2 inches across. This species, from its color and locality, is known as the *rose of Plymouth*. The various species are called most often by the generic name *Sabbatia*, and sometimes by the book-name *American centaury*. The plant is a simple bitter tonic. *S. chloroides*, *S. campestris*, and *S. angularis* are introduced into flower-gardens. See *bitter-bloom* and *rose-pink*.

Taking the Semitic letters in their final order, we find that they fall into three groups. . . . the three sibilants or *sabbatical* letters occupying the three *sabbatical* places as the 7th, 14th, and 21st letters. Remembering the importance attached among all Semitic races to the sacred planetary number seven, it seems probable that it was not by mere accident that the sibilants came to occupy these positions.

Isaac Taylor, The Alphabet, I. 192.

Dr. H. More, Def. of Moral Cabbala, II.

What an eternal *sabbatism*, then, when the work of redemption, sanctification, preservation, glorification, are all finished, and his [God's] work more perfect than ever, and very good indeed!

Baxter, Saints' Rest, I. 4.

Christ, having entered into his *Sabbatism* in heaven, gives us a warrant for the Christian Sabbath or Lord's day, which has the same relation to Christ's present Sab-

A *Sabbatizing* too much, by too many Christians imitated, which celebrate the same rather as a day of Bacchus than the Lord's day. *Purchas*, Pilgrimage, p. 122.

Let us not therefore keep the sabbath (or *sabbatize*) Jewishly, as delighting in idleness (or rest from labour).

Baxter, Divine Appointment of the Lord's Day, vii. If he who does not rest out of regard to the Lord does not truly *Sabbatize*, his resting is only an empty form or a blasphemous pretense. *Pop. Sci. Mo.*, XXIX. 708.

Sabellianism arose out of an attempt to explain the doctrine of the Trinity on philosophical principles. It agrees with orthodox Trinitarianism in denying the subordination of the Son to the Father, and in recognizing the divinity manifested in Christ as the absolute deity; it differs therefrom in denying the real personality of the Son, and in recognizing in the Father, Son, and Holy Spirit not a real and eternal Trinity, but one only temporal and modalistic. According to Sabellianism, with the cessation of the manifestation of Christ in time the Son also ceases to be Son. It is nearly allied to *Modalism*.

There are about 12 species, natives of tropical and temperate parts of Asia. They are climbing or twiggly shrubs, with roundish branchlets, around the base of which bud-scales remain persistent. They bear alternate and entire petioled leaves, and small axillary flowers, which are solitary, cymose, or panicle.

It includes about 40 species, belonging to 4 genera, of which *Sabia* is the type, natives of tropical and subtropical regions, chiefly northern. They are smooth or hairy shrubs or trees, bearing alternate simple or pinnate feather-veined leaves without stipules, and usually small flowers in panicles.

A digitigrade carnivorous quadruped, *Mustela zibellina*, of the family *Mustelidae* and subfamily *Mustelinae*, closely related to the martens. It inhabits arctic and subarctic regions of the Old World, especially Russia and Siberia, having a copious lustrous pelage, of a dark-brown or blackish color, yielding one of the most highly prized of pelts. The animal is about 18 inches long, with a full bushy tail nearly a foot long; the limbs are short and stout, with small paws. The nose is sharp, and the ears are pricked. There are three kinds of hairs in the pelage—a short soft dense under-fur,

Sable (*Mustela zibellina*).

a second set of longer hairs, kinky like the first but coming to the surface, and fewer longer glistening hairs, bristly to the very roots. The pursuit of the sable forms an important industry in Siberia. The pelt is in the best order in winter. The darkest furs are the most valuable. None are dead-black, nor is the animal ever uniformly dark-colored, the head being quite gray or even whitish, and there is usually a large tawny space on the throat, which color may be found also in blotches over much of the under surface. Some other martens, resembling the true sable, receive the same name. Thus, the American marten, *M. americana*, is a sable hardly distinguishable from that of Siberia, except in some technical dental characters. Its fur is very valuable, though usually not so dark as that of the Siberian sable. *M. melanopus* of Japan is a kind of sable. See also cut under *marten*.

Audubon and Bachman's statement that the fur [of the skunk] "is seldom used by the hatmakers, and never, we think, by the furriers; and, from the disagreeable task of preparing the skin, it is not considered an article of commerce," was wide of the mark, unless it was penned before "*Alaska sable*" became fashionable.

saccharose (sak'a-rōs), *n.* [*< ML. saccharum + -ose.*] 1. The general name of any crystalline sugar having the formula $C_{12}H_{22}O_{11}$ which suffers hydrolysis on heating with water or dilute mineral acid, each molecule yielding two molecules of a glucose. The saccharoses are glucose anhydrides. The best-known are *saccharose* or *cane-sugar*, *milk-sugar*, and *maltose*.

2. Specifically, the ordinary pure sugar of commerce, obtained from the sugar-cane or sorghum, from the beet-root, and from the sap of a species of maple. Chemically, pure saccharose is a solid crystalline body, odorless, having a very sweet taste, very soluble in water, less soluble in alcohol, and insoluble in absolute alcohol. Its aqueous solution is strongly dextrorotatory. It melts at 160° C., and decomposes at a higher temperature. Heated sufficiently with water or dilute mineral acid, it breaks up into equal parts of dextrose and levulose. Saccharose does not directly undergo either alcoholic or lactic fermentation; but in the presence of certain ferments it is resolved into dextrose and levulose, which are readily fermentable. It unites directly with many metallic oxides and hydrates to form compounds called *sucrates* or *saccharates*. Saccharose is extensively used both as a food and as an antiseptic. It is also used to some extent in medicine. Also called *cane-sugar*.

[*cap.*] [NL., Linnaeus, 1737.] A genus of grasses of the tribe *Andropogoneæ*, type of the group *Saccharææ*. It is characterized by minute spikelets in pairs, one of each pair stalked and the other sessile, each spikelet composed of four awnless hyaline glumes, of which three are empty and the terminal one shorter, blunt, and including three stamens and a free oblong grain. It differs from the nearly related ornamental grass *Erianthus* in its awnless glumes, and from *Sorghum* in having a fertile and perfect flower in each

spikelet of a pair. It resembles *Zea*, the Indian corn, with monocious flowers, and *Arundo*, the cane, with several-flowered spikelets, in habit only. It includes about 12 species, natives of warm regions, probably all originally of the Old World. They are tall grasses, with leaves which are flat, or convolute when dry, and flowers in a large terminal panicle, densely sheathed everywhere with long silky hairs. By far the most important species is *S. officinarum*, the common sugar-cane. See *sugar-cane*; also *kans* and *moonja*.—*Saccharum candidum*. 2. A unit of dry measure. English statutes previous to American Independence fixed the sack of flour and meal at 5 bushels or 280 pounds, that of salt at 5 bushels, that of coal at 3 bushels (the sacks to measure 50 by 28 inches), and that of wool at 34 hundred-weight or 364 pounds. Since 1870 the British sack has been 4 imperial bushels. Locally, sacks of 2, 3, 3½, and 4 bushels were used as measures in England. The sack has been a widely diffused unit, varying in different countries, from 2 to 4 Winchester bushels. Thus, it was equal to 2 such bushels at Florence, Leghorn, Leyden, Middelburg, Tournon, etc.; to 2½ at Zealand and Beaumont; to 2½ at Haarlem, Goes, Geneva, Bayonne; to 2½ at Amsterdam; to 2½ at Agen, Utrecht, etc.; to 2½ at Dort and Montauban; to 2½ at Granada and Emden; to 2½ at Ghent; to 3 at Strasburg, Rotterdam, The Hague, and in Flanders (the common sack); to 3½ at Brussels; and to 3½ at Basel. The sack of Hamburg was nearly 6 bushels, that of Toulouse still greater, while the sack of Paris, used for plaster, was under a bushel.

sack² (sak), *n.* [*< F. sac* = *Sp. saco* = *Pg. sacco*, *sacco*, *sacque* = *It. sacco*, sack, plunder, pillage; ult. *< L. saccus*, a bag, sack (see *sack*); but the precise connection is uncertain. In one view, it is through a particular use of the verb represented by *E. sack*¹, 'put into a bag,' and hence, it may be supposed, 'conceal and take away' (cf. *bag*, and *pocket*, in similar uses); but no such use of the *OF.* and *ML.* verb appears, the *Rom.* verbs meaning 'sack' being secondary forms, depending on the noun (see *sack*¹, *r.*, *sac-cage*, *r.*); besides, the town or people 'sacked' is not 'put into a bag.' The origin is partly in the *OF.* "a *sac*, a *sac*, the word whereby a commander authorizeth his souldiers to sack a place or people" (Cotgrave), = *It. a sacco*, "a *sacco*, *asaccomano*, to the spoile, to the sacke, ransakt" (Florio)—the exhortation a *sac*, *It. a sacco*, 'to plunder,' prob. meaning orig. 'to bag!' i. e. fill your pouches (*OF. sac* = *It. sacco*, a bag, pouch, wallet, sack: see *sack*¹, *n.*); and partly in the *Sp. sacomano*, a plunderer, also sack, plunder, pillage, = *It. saccomano*, a plunderer, freebooter, scout, soldier's servant, also plunder; *< ML. saccomannus*, a plunderer, *sac-comannum*, plunder, *< MHG. sackman*, a soldier's servant, camp-servant (*sackman machen*, plunder), lit. 'sack-man,' one who carries a sack, *< sack*, = *E. sack*, + *man* = *E. man*.] 1. The plundering of a city or town after storming and capture; plunder; pillage: as, the *sack* of Magdeburg.

These were often sweetened, and mixed with eggs and other ingredients, to make a sort of punch. The name *sweet sack* was then given to wines of similar strength and color, but requiring less artificial sweetening. In the seventeenth century the name seems to have been given alike to all strong white wines from the south, as distinguished from Rhenish on the one hand and red wines on the other.

2. In *theol.*, an outward and visible sign of inward and spiritual grace; more particularly, a solemn religious ceremony enjoined by Christ, or by the church, for the spiritual benefit of the church or of individual Christians, by which their special relation to him is created or freshly recognized, or their obligations to him are renewed and ratified. In the Roman Catholic Church and the Greek Church there are seven sacraments—namely, baptism, confirmation, the eucharist, penance, holy orders, matrimony, and (in the Roman Catholic Church) extreme unction or (in the Greek Church) unction of the sick. Protestants in general acknowledge but two sacraments, baptism and the Lord's Supper. The difference of view as to the value or significance of sacraments is more important than the difference as to their true number. In general it may be said that there are three opinions respecting them: (a) that the sacrament is a means of grace acting directly upon the heart and life, "a sure and certain means to bring peace to our souls" (*Bishop Hay, Sincere Christian*); (b) that the sacrament, though not in itself the means of grace, is nevertheless a solemn ratification of a covenant between God and the individual soul; (c) that the sacrament is simply a visible representation of something spiritual and invisible, and that the spiritual or invisible reality may be wanting, in which case the symbol is without spiritual value or significance. The first view is held by the Roman Catholics, the Greeks, and some in the Anglican communion; the second by most Protestants; the third by the Zwinglians, the Socinians, and, in modern times, by some of the orthodox churches, especially of the Congregational denominations. The Quakers, or Friends, reject altogether the doctrine of the sacraments.

The animal to which the name specially applies is the hanuman or entellus monkey of India, *S. entellus*. The name also extends to some other monkeys which receive similar attentions, as the bunder or rhesus macaque, *Macacus rhesus*, and the talapoin. See cuts under *entellus*, *rhesus*, and *talapoin*.—**Sacred ax**, **bamboo**, **bean**. See the nouns.—**Sacred baboon**, the hamadryad, *Cynocephalus hamadryas*, venerated in Egypt, and often sculptured on tombs and monuments. This animal played an important part in Egyptian theology and priestcraft.—**Sacred bark**, casara sagrada bark. The "cat-cemeteries" recently opened at this place have furnished so many of these objects that they have become of commercial value as a fertilizer. This kind of cat is also interesting as indicating

the origin of the present domestic cats from the *Felis maniculatus* of Ruppell, a native of Abyssinia. This is a true feline, apparently first domesticated in Egypt. The animal whose classic name (αἰσώπος) has commonly been translated *cat* was quite different, being either a musteline or a viverrine. See *Elurus*, *cat*.—**Sacred college**, **fig**, **fir**. Some such fish surmounts the head of Isis in some of her representations. See cut under *Malapterurus*.—**Sacred geography**. See *geography*.—**Sacred glosses**, **Heart history**. See *vulture*.—**Syn. Sacred, Holy**. *Holy* is stronger and more absolute than any word of cognate meaning. That which is *sacred* may derive its sanction from God or as connected with him. Hence we speak of the *Holy Bible*, and the *sacred* writings of the Hindus. He who is *holy* is absolutely or essentially free from sin; *sacred* is not a word of personal character. The opposite of *holy* is *sinful* or *wicked*; that of *sacred* is *secular*, *profane*, or *common*.

By the original meaning, *sacrifice* might apply to offerings of any sort, but *immoderate* only to sacrifices of life: this distinction still continues, except that, as most sacrifices have been the offering of life, *sacrifice* has come to mean that presumably. It has taken on several figurative meanings, while *immoderate* has come to seem a strong word, especially appropriate to the offering of a large number of lives or of a valuable life. *Immoderation* is naturally for propitiation, while *sacrifice* may be for that or only for worship.

In man the sacrum normally consists of five sacral vertebrae thus united, and is the largest, stoutest, and most solid part of the vertebral column, forming a curved pyramidal mass with the base uppermost, the keystone of the

pelvic arch, wedged in posteriorly between the ilia, with which it articulates or unites by the sacro-iliac synchondrosis, all the body above being supported, so far as its bony basis is concerned, by the sacrum alone. A similar

but narrower, straighter, less pyramidal and more horizontal sacrum composed of a few bones (usually two to five, sometimes ten) characterizes *Mammalia* at large. (See *sacral*.) In birds a great number of vertebrae are ankylosed to form the sacrum or so-called sacrum, and a large number unite with the ilia, but the greater num-

ber of these are borrowed from both the lumbar and the coccygeal series, and in this class it has been proposed to limit the term *sacrum* to the few (three to five) vertebrae which are in special relation with the sacral plexus. (See *urosacral*.) In some reptiles or batrachians a single rib-bearing vertebra may be united with the ilia, and so represent alone a sacrum. Also called *rump-bone*. See also cuts under *epileura*, *Ornithoscelida*, *pelvis*, *Ichthyosauria*, *Dinornis*, *pterodactyl*, *sacrum*, *2*, and *marsupial*. — *Corvus* of the *sacrum*. See *cornu*. — *Curve of the sacrum*, the longitudinal concavity of the sacrum, remarkably deep in man. It approximates to Carus's curve, which is the curved axis of the true pelvis of the human female. — *Promontory of the sacrum*, the sacrovertebral or sacrolumbar angle, made between the sacrum and the antecedent vertebra, remarkably salient in man.

It is not easy to define exactly the doctrine of the Sadducees, because it was a negative rather than a positive philosophy, and a speculative rather than a practical system; and for our knowledge of it we are almost wholly dependent on the representations of its opponents. It was the doctrine of the rich, the worldly, and the compliant.

Sadduceism has so completely become the quasi-scientific term of theology for the indifference or unbelief of the day, and especially for the sceptical tone of modern literature, that one might have expected the undoubted orthodoxy of the Pharisees would have saved them from reproach. *H. One or two more of the same sort are *safe* to make him an associate.

=Syn. 1 and 2. *Safe, Secure*. These words once conformed in meaning to their derivations, *safe* implying free from danger present or prospective, and *secure* free from fear or anxiety about danger; they are so used in the quotation. Now the two words are essentially synonymous, except that *secure* is perhaps stronger, especially in emphasizing freedom from occasion to fear.

We cannot endure to be disturbed or awakened from our pleasing lethargy. For we care not to be *safe*, but to be *secure*; not to escape hell, but to live pleasantly.
Jer. Taylor, Slander and Flattery, Sermon xlv.

II. n. 1†. Safety.

If I with *safe* may graunt this deed,
I will it not refuse.

Preston, K. Cambises (Hawkins, Eng. Dr., l. 508). (Davies.)

2. A place or structure for the storage of money, papers, or valuables in safety from risk of theft or fire. Safes as now made may be divided into two classes: stationary safes of stone, brick, or metal, built as part of the structure of a warehouse, store, or other building, and commonly called *vaults*; and portable safes of steel and iron. The term *safe* is usually restricted to portable safes, whatever their size or material. These safes are usually of two or more metals, as cast-iron, chilled iron, and steel, combined in various ways to resist drilling, and are made with hollow walls filled with some non-conductor of heat. A great variety of devices have been added to safes to insure greater efficiency, such as rabbeted airtight doors, time-locks, and burglar-alarms. See *lock¹, alarm, 5, safe-deposit*, and phrases below.

3. A receptacle for the storage of meat and provisions. It is usually a skeleton frame of wood covered with fine wire netting to keep out insects.—4. Any receptacle for storing things in safety: as, a match-*safe*, milk-*safe*, coin-*safe*, etc.—5. A floating box or car for confining living fish.—6. A sheet of lead with the sides turned up, placed under a plumbing fixture to catch moisture or fluids due to leaks or carelessness, and thus protect floors and ceilings.—7. In *saddlery*, a piece of leather placed beneath a buckle to prevent chafing. *E. H. Knight*.—8. In *distilling*, a closed vessel attached by a pipe to the worm of a still, for the retention of a sample of the product, to be subsequently inspected by excise officers.—**Burglar-proof safe**, a safe constructed for protecting property against burglars. The inner compartment of the

twisted to produce alternate strata of steel and iron, and thus prevent their being drilled. The body (see the section) is made up of alternate plates of steel (*a*) and iron (*b*), the steel plates being interposed to obstruct drilling. The large bolts *d* are conical in form, and the smaller countersunk screws, as well as the lock-spindle, are all made of twisted iron and steel laminated like the bolts. In the most recent construction the lock-spindle, instead of being a single piece, is made sectional, the sections being socketed each into another to present still further obstruction to drilling. Compound hinges are also provided, whereby the door can be at first moved parallel to itself before swinging back, and an airtight packing is interposed between the jambs and their abutments.—**Fire-proof safe**, a safe for the protection of property against fire. When the safe here figured is exposed to heat the alum gives off its water of crystallization, which becomes steam at ordinary atmospheric pressure, thus inclosing the contents in an envelop of steam at 212° F., which is maintained until the water is all expelled.

the case were the flame not protected from contact with the gas. The basis of the safety-lamp, an invention of Sir Humphry Davy in 1816, is the fact, discovered by him, that flame cannot be communicated through a fine wire gauze. About 784 apertures to the square inch is the number generally adopted, the lamp being surrounded by a cylinder, about an inch and a half in diameter, made of a metallic gauze of this description. Various improvements have been made by Clanny, George Stephenson, Mueseler, and others, in the safety-lamp as originally devised by Davy. Stephenson's lamp is called by the miners a *geordie*. The Mueseler lamp is the one chiefly used in Belgium, and has been introduced in England. The essential feature of the Davy lamp remains in all these improvements, the object of which is to get more light, to secure a more complete combustion of the oil, and to prevent the miners from using the lamp without the gauze.

The paper may be colored with a pigment which must be defaced if the surface is tampered with, treated with a chemical which causes writing upon it to become fixed in the fiber, made up of several layers having special characteristics, peculiarly water-marked, incorporated in the pulp with a fiber of silk, etc. The last method is used for the paper on which United States notes are printed.

safety-pin (săf'ti-pin), *n.* A pin bent back on itself, the bend forming a spring, and having the point fitting into a kind of sheath, so that it may not be readily withdrawn or prick the wearer or others while in use.

safety-plug (săf'ti-plug), *n.* 1. In steam-boilers, a bolt having its center filled with a fusible metal, screwed into the top of the fire-box, so that when the water becomes too low the increased temperature melts out the metal, and thus admits steam into the fire-box or furnace to put the fire out. Also called *fusible plug*.—2. A screw-plug of fusible metal used for the same purpose in steam-heating boilers carrying pressures of from 5 to 10 pounds.—3. It is passed over the seat of a gig-saddle, the terrets of which are inserted through holes in the strap. The ends of the strap are buckled to the shaft-tugs. — **Brake safety-strap**, an iron or steel strap so bent as to embrace the brake-beam of a car-truck, to the end-pieces or transoms of which the ends of the safety-strap are secured. Its function is to prevent the beam from falling on the track if any of the hangers give way. It is sometimes made to serve as a brake-spring to throw off the brake.

safety-tackle (săf'ti-tak'l), *n.* An additional tackle used to give greater support in cases where it is feared that the strain might prove too great for the tackles already in use.

safety-tube (săf'ti-tüb), *n.* In *chem.*, a tube, usually provided with bulbs and bent to form a trap, through which such reagents as produce noxious fumes may be added to the contents of a flask or retort, or by which dangerous pressure within a vessel may be avoided.

safety-valve (săf'ti-valv), *n.* A contrivance

Ordinary weighted Safety-valves.

a and *b* show the weight applied with levers as in power-boilers, while in *c* and *d* the weights are directly applied to the valve-stem—a common method with low-pressure steam-boilers used for steam-heating.

for obviating or diminishing the risk of explosion in steam-boilers. The form and construction of safety-valves are exceedingly various, but the principle of all is the same—that of opposing the pressure within the boiler by such a force as will yield before it reaches the point of danger, and permit the steam to escape. The most simple and obvious kind of safety-valve is that in which a weight is placed directly over a steam-tight plate fitted to an aperture in the boiler. When, however, the pressure is high, this form becomes inconvenient, and the lever safety-valve is adopted. — **Internal safety-valve**, in a steam-boiler, a valve which opens inward to admit air into the boiler when a partial vacuum has been formed by the condensation of the steam. — **Lock-up safety-valve**, a safety-valve having the weighted lever or spring shut in a locked chamber so that it cannot be interfered with except by the person holding the key. — **Spring safety-valve**, a form of safety-valve the pressure of which is controlled by a gaged or adjustable spring or set of springs.

Europe, Egypt, India, and China. It is sometimes planted in herb- and flower-gardens in the United States. Safflower as a medicine has little power, but is still in domestic use as a substitute for saffron. As a dyestuff (its chief application), it imparts bright but fugitive tints of red in various shades. It is extensively used at Lyons and in India and China in dyeing silks, but has been largely replaced by the aniline dyes. It is much employed in the preparation of rouge, and serves also to adulterate saffron. (See *carthamin*.) In India a lighting and culinary oil is largely expressed from its seeds. Also called *African*, *false* or *bastard*, and *dyers' saffron*.

(> Pers.) zafarān*, with the article *az-zafaran*, saffron, < *Ar. (> Turk. Pers.) safrā*, yellow (as a noun, bile).] *I. n.* 1. A product consisting of the dried stigmas of the flowers of the autumnal crocus, *Crocus sativus*. The true saffron of commerce is now mostly *hay saffron*—that is, it consists of the loose stigmas uncaked. The product of over four thousand flowers is required to make an ounce. It has a sweetish aromatic odor, a warm pungent bitter taste, and a deep orange color. In medicine it was formerly deemed highly stimulant, antispasmodic, and even narcotic; it was esteemed by the ancients and by the Arabians; and on the continent of Europe it is still much used as an emmenagogue. Experiments, however, have shown that it possesses little activity. It is also used to color confectionery, and in Europe and India is largely employed as a condiment. Saffron yields to water and alcohol about three fourths of its weight in an orange-red extract, which has been largely used in painting and dyeing, but in the latter use is mostly replaced by much cheaper substitutes.

A plant of the genus *Salvia*, especially *S. officinalis*, the common garden sage.

Sage (*Salvia officinalis*).
1, inflorescence; 2, lower part of stem with leaves.

This is a shrubby perennial, sometimes treated as an annual, with rough hoary-green leaves, and blue flowers variegated with white and purple and arranged in spiked whorls. Medicinally, sage is slightly tonic, astringent, and aromatic. It was esteemed by the ancients, but at present, though official, is little used as a remedy except in domestic practice. The great use of sage is as a condiment in flavoring dressings, sausages, cheese, etc. In Europe *S. pratensis*, the meadow-sage, a blue-flowered species growing in meadows, and *S. sclarea*, the clary, are also official, and the latter is used in soups, but the taste is less agreeable. The ornamental species (which include the two last named) are numerous, and in several cases brilliant. Such are the half-hardy *S. splendens*, the scarlet sage of Brazil; *S. fulgens*, the cardinal or Mexican red sage; and the Mexican *S. patens*, with deep-blue, widely ringent corolla over two inches long. The European *S. argentea*, the silver-leaved sage, or clary, is cultivated for its foliage. Blue-flowered species fit for the garden, native in the United States, are *S. aurea* of the southern States, *S. Picheri*, with the leaves minutely soft-downy, found from Kansas to Texas, and the Texan *S. farinosa*, with a white hoary surface. See *chia*, *dary*², and phrases below.

See def. 1.—**Mountain-sage**. Same as *wood-sage*.—**Sage cheese**. See *cheese*¹.—**Sage tea**. See *tea*.—**Scarlet sage**. See def. 1.—**White sage**. (a) A woolly chenopodiaceous plant, *Eurotia lanata*. (b) See *Kochia*. (c) In southern California, another whitish plant of the same order, *Audubertia polytachya*, a shrub from 3 to 10 feet high, useful in bee-pastures. See cut under *Centrocercus*.

There are about 12 species, natives of warmer parts of the United States, of Java, and of central and southern Asia. They are shrubs with slender or rigid opposite branches, either with or without thorns, and commonly projecting at right angles to the stem. They bear short-stalked oblong or ovate leaves with netted veins, not triple-nerved as often in the related *Ceanothus*, and furnished with minute stipules. The flowers are very small, each with five hooded and stalked petals, and followed by small globose drupes containing three hard nutlets. *S. theezans*, of China and the East Indies, is a thorny shrub with bright-green ovate leaves, the *tia* of the Chinese, among whom its leaves are said to be used by the poorer classes as a substitute for tea.

(See *sago-palm*.) The tree, which in the case of the proper sago-palms naturally flowers but once, is felled when just ready to flower, the trunk cut in pieces, the pith-like matter separated, and the starch washed from it. After due settling, the water is drained off, and the deposited starch may be caked, as it is for native use, or dried into a meal which is

Saguin (*Callithrix personatus*).

—*Syn.* *Saguin, sajou, sai, saimiri, sapajou*. These are all native names of South American monkeys, now become inextricably confounded by the different usages of authors, if indeed they had originally specific meanings. *Sai* is the

most general term, meaning monkey. *Sajou* and *sapajou* are the same, meaning a prehensile-tailed monkey of one of the genera *Cebus* and *Ateles*; but *sapajou* has become associated specially with *Ateles*, then meaning spider-monkey. *Saguin* was one of the smaller species of *Cebus*, but became confused with *saimiri*. *Saguin* and *saimiri* are now specially attached to the small non-prehensile-tailed squirrel-monkeys, respectively of the genera *Callithrix* and *Chrysothrix*, but are also loosely used for any of the marmosets.

There is only one species, the saiga or saiga-antelope, *Antelope saiga*, *Colus saiga*, or *Saiga tartarica*, inhabiting western Asia and eastern Europe. Also called *Colus*. See cut in next column.

saiga-antelope (sā'gā-an'tē-lōp), *n.* The saiga.

Saigidae (sā-i-gī-dē), *n. pl.* [NL., < *Saiga* + *-idae*.] In J. E. Gray's classification, a family of hollow-horned ruminants, represented by the genus *Saiga*; the saiga-antelopes, having the nose peculiarly inflated and expanded, the conformation affecting not only the outward parts, but the bones of the nasal region. The nasal bones are short, arched upward, and entirely separated from the maxillaries and lacrymals; the frontal bone projects between the lacrymals and nasals, and the maxillaries and premaxillaries are both much reduced. The group would be better named *Saiginae*, as a subfamily of *Bovidae*.

sailless (sāk'les), *a.* A dialectal (Scotch) form of *sackless*.

sail¹ (sāl), *n.* [*ME. saile, sayle, seil, seyl*, < AS. *segel*, *segl* = OS. *segel* = MD. *seyl*, D. *zeil* = MLG. *LG. segel, seil* = OHG. *segal*, MHG. *G. segel* = Icel. *segl* = Sw. *segel* = Dan. *sejl* (Goth. not recorded), a sail. Root unknown; certainly not < L. *sagulum*, a mantle.] 1. A piece of cloth, or a texture or tissue of some kind, spread to the wind to cause, or assist in causing, a vessel to move through the water. Sails are usually made of several breadths of canvas, sewed together with a double seam at the borders, and edged all round with a cord or cords called the *bolt-rope* or *bolt-ropes*. A sail extended by a yard hung (slung) by the middle is called a *square sail*; a sail set upon a gaff, boom, or stay is called a *fore-and-aft sail*. (See *fore-and-aft*.) The upper part of every sail is the *head*, the lower part the *foot*, the sides in general are called *leeches*; but the weather side or edge (that is, the side next the mast or stay to which it is attached) of any but a square sail is called the *tuf*, and the other edge the *after leech*. The two lower corners of a square sail are in general *clues*; the weather clue of a fore-and-aft sail, or of a course while set, is the *tack*. Sails generally take their names, partly at least, from the mast, yard, or stay upon which they are stretched; thus, the main-course, maintopail, and maintopgallantsail are respectively the sails on the mainmast, maintopmast, and maintopgallantmast. The principal sails in a full-rigged vessel are the courses or lower sails, the topsails, and the topgallantsails. See *topail*, *topail-yard*, and cut under *ship*.

3. One who is eminent for consecration, holiness, and piety in life and character; specifically, one who is generally or officially recognized as an example of holiness of life, and to whose name it is customary to prefix *Saint* (abbreviated *St.* or *S.*) as a title. The persons so honored were, in the earlier centuries, the Virgin, the apostles and martyrs, and others commemorated in the diptychs or recognized by public opinion. In later times the process of canonization or beatification became a matter of strict regulation by papal or patriarchal authority in the Roman Catholic and Greek churches. Saints are classed in calendars by their rank, as apostles, bishops, archbishops, priests, deacons, kings, etc., and also as martyrs, confessors, and virgins. The title of *saint* is also given to angels, as *St. Michael*, *St. Gabriel*, *St. Raphael*. In the phrases given below many diseases will be found named from those saints whose intercession was especially sought for their cure. When *saint* is used before a person's name as a quasi-title (originally an adjective), it is commonly abbreviated *St.*; but such names, and surnames and local names derived from them, are properly alphabetized under the full form *saint*.

We have decided and defined the Blessed Francis de Sales, Bishop of Geneva, to be a *Saint*, and have inscribed him on the catalogue of the *Saints*.

Bull of Alexander VII. concerning St. Francis de Sales (1665), quoted in Cath. Dict., p. 114.

It consists essentially of a vertical wheel to which earthen pots are attached on projecting spokes, a second vertical wheel on the same axis with cogs, and a large horizontal cogged wheel, which gears with the other cogged wheel. The large wheel, being turned by oxen or other draft-animals, puts in motion the other two wheels, the one carrying the pitchers dipping into a well or a deep pit adjoining and supplied with water from a river. The pitchers are thus emptied into a tank at a higher level, whence the water is led off in a network of channels over the neighboring fields. Instead of the pitchers being attached directly to the wheel when the level of the water is very low, they are attached to an endless rope. The construction of these machines is usually very rude.

The lower extremities of the net are guided by a cord, which is drawn toward the raft at the same time that the long bamboos are elevated by the crane and counterpoise; only a small part of the net thus remains in the water, and is easily cleared of its contents by means of a landing-net.

The word *sale* is often used more specifically as indicating the consideration to be pecuniary, as distinguished from barter or exchange. It is also often used as indicating a present transfer, as distinguished from a contract to transfer at a future time, which is sometimes termed an *executory sale*. In respect to real property, *sale* usually means the executory contract or bargain, as distinguished from the deed of conveyance in fulfillment of the bargain.

Salic (*sāl'ik*), *a.* [*Also Salique*; *< OF. (and F.) salique* = *Sp. salico* = *Pg. It. salico*, *< ML. Salicus*, pertaining to the Salians (*lex Salica*, the Salic law), *< LL. Saliī*, a tribe of Franks: see *Salian*¹.] Based on or contained in the code of the Salian Franks: specifically applied to one of the laws in that code which excluded women from inheriting certain lands, probably because certain military duties were connected with such inheritance. In the fourteenth century females were excluded from the throne of France by the application of this law to the succession to the crown, and it is in this sense that the phrase *Salic law* is commonly used.

A French antiquarian (Claude Seissel) had derived the name of the *Salic Law* from the Latin word *sal*, comme une loy pleine de sel, c'est à dire pleine de sapience, and the Doctor thought a far more rational etymology than what some one proposed, either seriously or in sport, that the law was called *Salique* because the words *Si*

aliquis and *Si aliqua* were of such frequent occurrence in it. Southey, The Doctor, cccviii. (Davies.)

The famous clause in the *Salic Law* by which, it is commonly said, women are precluded from succession to the throne, and which alone has become known in course of time as the *Salic Law*, is the fifth paragraph of chapter 59 (with the rubric "De Alodis"), in which the succession to private property is regulated. It possesses tonic properties, and is sometimes used as a substitute for salicylic acid in the treatment of rheumatism.

Salicineæ (*sal-i-sin'ē-ē*), *n. pl.* [*NL. (L. C. Richard, 1828)*, *< Salix (Salic-) + -in-æ*.] A well-defined order of apetalous plants, little related to any other. It is characterized by dicious inflorescence with both sorts of flowers in catkins, a perianth or disk either cup-shaped or reduced to gland-like scales, two or more stamens to each flower, and a one-celled ovary becoming in fruit a two- to four-valved capsule with numerous minute seeds which bear a long dense tuft of white hairs at one end. There are 178 (or, as some estimate them, 300) species, natives of temperate and cold regions, widely scattered throughout the world, rarer in the tropics, and very few in the southern hemisphere. They are trees or shrubs, bearing alternate entire or toothed leaves, free stipules, and catkins produced before or with the leaves, often clothed with long silky hairs. The order is composed of but two genera, *Salix* (the type) and *Populus*. Also *Salicææ*.

A genus of apetalous plants of the order *Chenopodiaceæ*, type of the tribe *Salicorniæ*, having the flowers immersed in hollows of the upper joints of the stem, from which the two light-yellow anthers protrude. The small fleshy three- or four-toothed perianth becomes spongy and thickened in fruit, inclosing the ovoid utricle, which contains a single erect seed destitute of albumen, having a conduplicate embryo with two thickish seed-leaves. The 8 species are native of saline soils throughout the world, and are remarkable for their smooth, fleshy, leafless, and jointed stems, erect or decumbent, and bearing many short branches, their numerous joints dilated above into sheaths which form a socket partly inclosing the next higher joint. Their inconspicuous flowers form terminal fleshy and cylindrical spikes closely resembling the branches. See *glasswort* and *marsh-samphire*, also *erab-grass*, 2, and *junc*.

Salicorniæ (*sal'i-kōr-ni-ē-ē*), *n. pl.* [*NL. (Dumortier, 1827)*, *< Salicornia + -æ*.] A tribe of apetalous plants of the order *Chenopodiaceæ*. It is characterized by bisexual flowers immersed in the axils of scales of a cone or in hollows of the stem, and by the fruit which is a utricle included in an unappendaged and generally somewhat enlarged perianth. It includes 11 genera and about 31 species, many of them natives of salt-marshes. They are herbs or fleshy shrubs, with continuous or jointed branches, often leafless.

It is prepared commercially by the action of carbonic acid on sodium phenol (sodium carbonate). Salicylic acid has come into very general use as an antiseptic, and, being devoid of active poisonous properties, is employed for preserving foods, etc., from decay. It is also used in acute articular rheumatism and in myalgia.—**Salicylic aldehyde**, the aldehyde of salicylic acid, $C_6H_4.OH.CO_2H$, which occurs in the volatile oil of *Spirea*. Salix (sā'liks), *n.* [*NL.* (Tournefort, 1700), < *L. salix*, a willow: see *sallow*.] A genus of apetalous trees and shrubs, the willows, type of the order *Salicinae*, and characterized by a disk or perianth reduced to one or two distinct glands, and a one-celled ovary with a short two-cleft style, and two placentae each bearing commonly from four to eight ovules, arranged in two ranks. Unlike those of *Populus*, the other genus of the order, the leaves are commonly long and narrow, the catkins are dense, erect, and at first covered by a single bud-scale, the flowers sessile, stigma short, stamens usually but two, the bracts entire, and the seeds few in each two-valved capsule. There are over 160 species enumerated, often of very difficult limitation from the number of connecting forms and of hybrids. They are natives of all northern and cold regions, rare in the tropics, and very few in the southern hemisphere. One species only is known in South Africa, and one in South America, native in Chili: none occurs in Australasia or Oceania. About 20 are native to the northeastern United States; and they are

still more numerous northward, 10 species being reported from Point Barrow in Alaska alone. They are trees or shrubs, generally with long lithe branches and elongated entire or minutely toothed leaves, often with conspicuous stipules. A few alpine species are prostrate, and form matted turfs or send up small herb-like branches from underground stems. *S. arctica*, a wide-spread species of the far north, extends to latitude 81° 44' N., in the form, at sea-level, of dwarf shrubs a foot high, but with a trunk an inch thick. The catkins are conspicuous; in temperate climates they are usually put forth before the leaves, but in colder regions they commonly appear nearly at the same time. Most species grow along streams, and many are widely planted to consolidate banks, and thus have become extensively naturalized. Many are found in a fossil state. See *willow*, *osier*, and *sallow*; also cuts under *ament*, *inflorescence*, *lanceolate*, and *retuse*.

And I think this word *sallet* was born to do me good; for many a time, but for a *sallet*, my brain-pan had been cleft with a brown-bill; and many a time, when I have been dry, and bravely marching, it hath served me instead of a quart-pot to drink in; and now the word *sallet* must serve me to feed on.

It was formerly more than coextensive with the family as now understood, but is usually restricted to forms having the anal fin short, of only nine to eleven developed rays; the vomer flat, its surface plane and toothed; and the body spotted with black (not with red or silvery gray). In this sense the genus *Salmo* is exclusive of the charrs (*Salvelinus*) and of the Pacific salmon (*Oncorhynchus*). But even thus restricted it contains two sets of species: (a) True salmon, marine and anadromous, as *S. salar*, with the vomerine teeth little developed, no hyoid teeth, scales large, caudal fin well forked (truncate in old individuals), and sexual distinctions strong, the breeding males having the lower jaw hooked upward. Such salmon are sometimes landlocked, as the variety found in Sebago Lake, in Maine. See cut under *parr*. (b) River-salmon, not anadromous, with vomerine teeth highly developed, and sexual differences not strong. Such salmon are among the many fishes called *trout* or *salmon-trout* in the United States, as *S. trideus*, the rainbow-trout of California, which is a variety or subspecies of *S. gairdneri*, the steel-head or hard-head salmon-trout of the Sacramento river and northward, attaining a weight of twenty pounds (see cut under *rainbow-trout*); *S. purpuratus*, var. *spilargus*, the trout of the Rio Grande, Utah Basin, etc.; and *S. purpuratus*, the sal-

salmon (sam'un), n. [Early mod. E. also *salmōn*, *samon*; < ME. *salmon*, *salmōn*, usually *saumon*, *samon*, *saumoun*, *samoune*, < OF. *saumon*, *saumun*, *saulmone*, *saulmon*, *salmun*, F. *saumon*, a salmon (fish), = Pr. *salmo* = Sp. *salmon* = Pg. *salmão* = It. *salamone* = OS. OHG. *salmo*, MHG. *salme*, G. *sal*, < L. *salmo* (-n), a salmon, lit. 'leaper'; < *salire*, leap: see *sail*², *salient*.] 1. A fish of the genus *Salmo* (*S. salar*), found in all the northern parts of Europe, America, and Asia. The salmon is both a marine and a fresh-water fish. Its normal locality may be said to be off the mouth or estuary of the larger rivers, whence, in the season of

Atlantic Salmon (*Salmo salar*).

sexual excitement, it ascends to the spawning-beds, which are frequently far inland, near the head-waters of the rivers. On reaching the spawning-station, the female by means of her tail makes a furrow in the gravelly bed of the river, in which she deposits her spawn or eggs, num-

bering many thousands, which, when impregnated by the male accompanying her, she carefully covers up by rapid sweeps of her tail. At this season the snout of the male undergoes a strange transformation, the under jaw becoming hooked upward with a cartilaginous excrescence, which is used as a weapon in the combats which are frequent when two or more males attach themselves to one female. In this condition he is known as a *kipper*. The time occupied in spawning is from three to twelve days, and the season extends from the end of autumn till spring. After spawning, the salmon, both male and female, die or go to sea under the name of *spent fish*, *foal fish*, or *kells*, the females being further distinguished as *shedders* or *baggits*. In from 80 to 140 days the young fish hatches from the egg. Then it is about five eighths of an inch long. In this embryonic state it is nourished from a vitelline, or umbilical vesicle, suspended under the belly, containing the red yolk of the egg and oil-globules, to be absorbed later. When about fifty days old it is about an inch in length, and becomes a *sawlet* or *parr* (see cut under *parr*). It continues in the shallows of its native stream till the following spring, when it is from 3 to 4 inches long and is known as the *May parr*. It now descends into deeper parts of the river, where the weaker fish remain till the end of the second spring, the stronger ones till the end of the first spring only. When the season of its migration arrives, generally the month of May or June, the fins have become darker, and the fish has assumed a silvery hue. It is now known as a *smolt* or *salmon-fry*. The smolts now congregate into shoals and proceed leisurely seaward. On reaching the estuary they remain in its brackish water for a short time, and then proceed to the open sea. Of their life there nothing is known, except that they grow with such rapidity that a fish which reaches the estuary weighing, it may be, not more than 2 ounces, may return to it from the sea, after a few months, as a *grilse*, weighing 8 or 10 pounds. A grilse under 2 pounds is called a *salmon-peal*. In between two and three years the grilse becomes a *salmon*. The salmon returns in preference to the river in which it passed its earlier existence. It has been known to grow to the weight of 83 pounds; more generally it weighs from 15 to 25 pounds. It furnishes a delicious dish for the table, and is an important article of commerce. Its flesh is of a pinkish-orange color. The synonyms of *salmon* are very numerous. Nearly or quite exact local ones are *mort*, *simen*, *spod*. Salmon under two years old, which have not entered the sea, are generally called *parr*, *pink*, and *smolt*, or, more locally, *black-fin*, *brandling*, *brood*, *cockper*, *fingering*, *ginkin*, *graveling*, *gravel-laspring*, *hepper*, *jerkin*, *laspring*, *salmon-fry*, *salmon-spring*, *sawlet*, *skayger*, *skerling*, *smelt*, *sparring*, *sprag*. One which has returned from the sea a second time is a *gerling*; one which has remained in fresh water during summer is a *laurel*; a milder, or spawning male, may be called a *gib-fish* or *summer-cock*. In the Ribble, in Willughby's time, a two-year old salmon was called *spod*; a supposed three-year fish *mort*, or perhaps *pug*; a four-year fish, a *forktail*; a five-year fish, a *half-fish*, and a six-year one, a *salmon* specifically.

2. One of various fishes of the same family as the above, but of different genera. Some of these species are recognizable by an increased number of the anal rays (14 to 20), and by the fact that the jaws in the males at the breeding-season become peculiarly developed and hooked. They form the genus *Oncorhynchus*, and are collectively called *Pacific salmon*. Five such species occur in the North Pacific. (a) One of these, the humpbacked salmon, *O. gorbuscha*, has from 25 to 30 short gill-rakers and very small scales (over 200 in a longitudinal row). It reaches a weight of from 3 to 6 pounds, and is found as far south as Oregon or even in the Sacramento river. (b) Another, the dog-salmon, *O. keta* or *O. lapcephalus*, has less than 25 short gill-rakers, moderately small scales (about 150 in a longitudinal row), 13 or 14 anal rays, and 13 or 14 branchiostegal rays: the spots are faint or obsolete. It attains a weight of about 12 pounds, and extends southward (sparingly) to the Sacramento river, but is of little value. (c) The quinnat or king-salmon, *O. chavicha* or *O. quinnat*, has about 23 short gill-rakers,

Quinnat, or California Salmon (*Oncorhynchus chavicha*).

about 150 scales in a longitudinal row, 16 anal rays, 15 to 19 branchiostegal rays (those of the opposite sides often unlike), and the back and upper fins dotted with black. It reaches a weight of over 100 pounds, but the average in the Columbia river is about 22. It enters abundantly into the Sacramento river and still more numerous into the northern streams from both sides of the Pacific, and is by far the most important species of its genus. About 30,000,000 pounds are estimated to have been the average take for several years in the Columbia river alone, along whose banks extensive canneries are established to preserve the fish. (d) The silver or kisutch salmon, *O. kisutch*, has about 23 rather slender gill-rakers, rather large scales (about 130 in a row), and is bluish-green on the back, silvery on the sides, and punctulated with blackish, but without decided spots except on the top of the head, back, dorsal and adipose fins, and the upper rudimentary rays of the caudal fin. It grows to a weight of from 3 to 8 pounds, and is abundant southward to the Sacramento river, but is of little economic value. (e) The blue-back salmon, *O. nerka* or *O. lycaodon*, has about 30 or 40 comparatively long gill-rakers, rather large scales (about 130 in a row), and is normally colored bright-blue above and silvery on the sides, but the males in the fall become deep-red, and are then known in the interior as *redfish*. It attains a weight of from 4 to 8 pounds, and ascends the Columbia river and tributaries in abundance. It ranks next in value to the quinnat. In canning salmon in America the fish are cooked in the cans in which they are put up, unlike any fish canned in Europe, which are all cooked first and then canned and cooked again. (See *sardinet*, 1.) The salmon are first

cleaned and scaled, and have their heads, tails, and fins cut off. Then they are placed in tanks filled with salted water, where they remain some time to "slime" or be cleansed before being brought into the factory. They are then cut into pieces of the proper size to fill the cans. These pieces are placed in cans, which are subsequently filled with brine. The raw fish, thus pickled, are soldered in the cans, which are next placed on forms holding many hundreds and lowered by machinery into steam-boilers, where they are cooked for an hour. The next step is a nice process called *renting*. A little hole is pricked in the can to allow the gas within to escape, when the vent-hole is instantly soldered. A second cooking now takes place, after which the cans are taken from the boilers and showered with cold water. If the vacuum is perfect, showing a sound can, the top hollows in with the cooling process. If a can is in the least swollen, it is rejected.

3. One of various fishes, not of the family *Salmonidae*, suggestive of or mistaken for a salmon. (a) A scianoid fish, *Cynoscion maculatus*. See *squeteague*. [Southern coast of the U. S.] (b) A percoid fish of the genus *Stizostedion*; a pike-perch: more fully called *jack-salmon*. (c) In New Zealand, a serranoid fish, *Arripis salar*. (See also the phrases below.)

4. The upper bricks in a kiln, which in firing receive the least heat: so called from their color.

The arches, from necessity, are overburdened in consequence of prolonging the firing sufficiently to burn the top and sides of the kiln into respectable *salmon*.

The branchial and peribranchial spaces are continuous, opening by the branchial and atrial pores.

A compound (NaCl) of chlorine with the metallic base of the alkali soda, one of the most abundantly disseminated and important of all substances. It not only occurs in numerous localities in beds sometimes thousands of feet in thickness, but also exists in solution in the ocean, forming nearly three per cent. by weight of its mass. It is not only of the greatest

importance in connection with the business of chemical manufacturing, but is also an indispensable article of food, at least to all men not living exclusively on the products of the chase. Salt often occurs crystallized, in the isometric system, and has when crystalline a perfect cubic cleavage. Its specific gravity is about 2.2. When pure it is colorless. As it occurs in nature in the solid form, it is almost always mixed with some earthy impurities, besides containing more or less of the same salts with which it is associated in the water of the ocean (see *ocean*). It is not limited to any one geological formation, but occurs in great abundance in nearly all the stratified groups. The Great Salt Range of India is of Lower Silurian age; the principal supply of the United States comes from the Upper Silurian and Carboniferous; the most important salt-deposits of England, France, and Germany are in the Permian and Triassic; the most noted deposits of Spain are Cretaceous and Tertiary; and those of Poland and Transylvania are of Tertiary age. Salt is obtained (1) from evaporation of the water of the ocean and of interior saline lakes; (2) from the evaporation of the water rising naturally in saline springs or obtained by boring; (3) by mining the solid material, or rock-salt. The supply of the United States is chiefly obtained by evaporating the water rising in holes made by boring. The principal salt-producing States are Michigan, New York, Ohio, Louisiana, West Virginia, Nevada, California, and Kansas; it is also produced in Utah. The two first-named States furnished in 1888 about three-quarters of the total product of the United States. The salt of California is made by the evaporation of sea-water; that of Utah from the water of Great Salt Lake; that of Louisiana and of Kansas, in part, is obtained by mining rock-salt. The product of the other States named comes chiefly from the evaporation of brine obtained by boring. Salt is of great importance as the material from which the alkali soda (carbonate of soda) is manufactured, and thus may be properly considered as forming the basis of several of the most economically important branches of chemical manufacture. Salt is also an article of great historical and ethnological importance. By many nations of antiquity it was regarded as having peculiar relations to mankind. Homer calls it "divine." It has been and is still used as a measure of value.

Let salt on the trenchere with knife that be cene;
Not to myche, be thou were, for that is not gode.
Booke of Precedence (E. E. T. S., extra ser.), i. 60.
Then, when the languid flames at length subside,
He strows a bed of glowing embers wide,
Above the coals the smoking fragments turns,
And sprinkles sacred salt from lifted urns.

Abandon those from your table and salt whom your own or others' experience shall deserv dangerous.
Bp. Hall, Epistles, l. 8.

2. In chem., any acid in which one or more atoms of hydrogen have been replaced with metallic atoms or basic radicals; any base in which the hydrogen atoms have been more or less replaced by non-metallic atoms or acid radicals; also, the product of the direct union of a metallic oxide and an anhydride. (J. P. Cooke, Chem. Phil., p. 110.) The nomenclature of salts has reference to the acids from which they are derived. For example, *sulphates*, *nitrates*, *carbonates*, etc., imply salts of sulphuric, nitric, and carbonic acids. The termination -ate implies the maximum of oxygen in the acids, and -ite the minimum.
