The doctrine of perfect sanctification, sometimes also called the *doctrine of holiness*, held by a comparatively small number, is the doctrine that men may be and sometimes are perfected in holiness in the present life, and wholly, unreservedly, and undeviatingly consecrated to do the divine will, so that they are freed from all sin, though not from all mistakes or errors in judgment.

4. A provision of a law which enforces obedience by the enactment of rewards or penalties, called respectively *remuneratory* and *punitive sanctions*; hence, in utilitarian ethics, the knowledge of the pleasurable or painful consequences of an act, as making it moral or immoral.

By the laws of men, enacted by civil power, gratitude is not enforced: that is, not enjoined by the sanction of penalties to be inflicted upon the person that shall not be found grateful. *South*.

A Sanction then is a source of obligatory powers or motives: that is, of pains and pleasures; which, according as they are connected with such or such modes of conduct, operate, and are indeed the only things which can operate, as motives.

Bentham, *Introd. to Morals and Legislation*, III. 2. note.

The fear of death is generally considered as one of the strongest of our feelings. It is the most formidable sanction which legislators have been able to devise.

Macaulay, *Mill on Government*.

The internal sanction of duty, whatever our standard of duty may be, is one and the same—a feeling in our own mind, a pain, more or less intense, attendant on a violation of duty. *J. S. Mill*, *Utilitarianism*.

The consequences which an action done here may have in the unseen world are the sanctions attached to it. *Hodgson*, *Phil. of Reflection*, III. xi. § 6.

External sanction, the knowledge of a fact in the external world which will result from an act either always or in the long run, and so produce pleasure or pain, as an inducement to do or refrain from that sort of act.—**Internal sanction**, the knowledge of mental reflection upon an act, productive of pleasure or pain, as an inducement to do or refrain from that sort of act.—**Legal sanction**, the knowledge that a penalty will probably be inflicted by a court for an act, as an inducement to refrain from that act.—**Moral sanction**, according to Bentham, the knowledge of how one's neighbors will take a given act, as a motive for doing or not doing it. Less strict utilitarians, as Mill, admit an internal sanction as moral. Non-utilitarian moralists often use the phrase *moral sanction*, but with no determinate signification. Thus, the intuitionist Calderwood (*Handbook of Moral Philos.*, I. ii. 4, § 7) says: "Sanction is a confirmation of the moral character of an action, which follows it in experience."

This makes *sanction* in this phrase mean not a reward or punishment, but an attestation. On the other hand, the evolutionist Stephen (*Science of Ethics*, X. i. 2) says: "According to my argument, the primary and direct incidence, if I may say so, of moral sanctions is upon the social organism, whilst the individual is only indirectly and secondarily affected." That is to say, races in which certain instincts are weak are unfitted to cope with other races, and go under; so that a moral sanction is a remote consequence of a line of behavior tending by natural selection to reinforce certain instincts.—**Physical sanction**, the knowledge that pleasure or pain will generally result from a given line of conduct by the operation of causes purely natural.—**Political sanction**, the hope of favor or fear of hostility on the part of a government as the consequence of, and thus a motive for or against, certain conduct.—**Popular sanction**, the knowledge that the people, in their private and individual capacity, will regard with favor or disfavor a person who acts in a given way, as a motive for or against such action. Bentham regards this as the same as *moral sanction*.—**Pragmatic sanction**. See *pragmatic*.—**Psychological sanction**, the knowledge that certain conduct, if found out, will act upon a certain mind or certain minds to cause those persons to confer pleasure or inflict pain upon the person who pursues such conduct, this knowledge being considered as a motive for or against that conduct.—**Punitive sanction**, the attachment of a penalty to a legal offense.—**Religious sanction**, the belief that God attaches rewards and punishments to his laws as a motive for obeying him.—**Remuneratory sanction**, the promise, as by a government, of a reward as an incitement to attempt a certain performance.—**Social sanction**. Same as *popular sanction*. = *Syn. 1* and *3*. Authorization, countenance, support, warrant.

seintuarie, < *OF. saintuaire, santuaire, saintuairio*, *F. sanctuaire* = *Pr. sanctuari* = *Sp. Pg. It. santuario*, < *LL. sanctuarium*, a sacred place, a shrine, a private cabinet, *ML.* also temple, church, churchyard, cemetery, right of asylum, < *L. sanctus*, holy, sacred: see *saint*¹.] 1. A sacred or consecrated place; a holy spot; a place in which sacred things are kept.

Proverbs, like the sacred books of each nation, are the sanctuary of the intuitions. *Emerson*, *Compensation*.

Specifically—(a) In *Scip.*, the temple at Jerusalem, particularly the most retired part of it, called the *holy of holies*, in which was kept the ark of the covenant, and into which no person was permitted to enter except the high priest, and that only once a year to intercede for the people. The same name was given to the corresponding part of the tabernacle in the wilderness (*Ex. xxv. 8*). (b) A house consecrated to the worship of God; a church.

And I saw crowds in column'd sanctuaries.

Tennyson, *Fair Women*.

(c) The cella or most sacred part of an Egyptian, Greek, or Roman temple. (d) In *classical antiq.*, a sacred place, a locality, whether inclosed or not, but generally inclosed, consecrated to some divinity or group of divinities, often a grove, sometimes an inclosure of notable size and importance, containing shrines, temples, a theater, arrangements for gymnastic contests, places of shelter for suppliants or for the sick, etc.: as, the sanctuary of *Esculapius* at Epidaurus.

Myrc, *Instructions for Parish Priests* (E. E. T. S.), I. 330.

Seintuarie, churchyard. The name of sanctuary is now given to that part of the choir or chancel of a church where the altar stands. In mediæval documents belonging to this country, Sanctuarium and its equivalents in English almost always mean churchyard.

Note in *Myrc's Instructions for Parish Priests* (E. E. T. S.), [p. 75].

2. A place of refuge or protection; a sacred asylum; specifically, a church or other sacred place to which is attached the privilege of affording protection from arrest and the ordinary operation of the law to criminals, debtors, etc., taking refuge within its precincts. From the time of Constantine downward certain churches have been set apart in many Catholic countries to be an asylum for fugitives from the hands of justice. In England, particularly down to the Reformation, any person who had taken refuge in such a sanctuary was secured against punishment—except when charged with treason or sacrilege—if within the space of forty days he gave signs of repentance, and subjected himself to banishment. By the act 21 James I., c. xxviii., the privilege of sanctuary for crime was finally abolished. Various sanctuaries for debtors, however, continued to exist in and about London till 1697, when they too were abolished. In Scotland the Abbey of Holyrood House and its precincts still retain the privilege of giving sanctuary to debtors, and one who retires thither is protected for twenty-four hours; but to enjoy protection longer the person must enter his name in the books kept by the bailie of the abbey. Since the abolition of imprisonment for debt this sanctuary is no longer used.

Whitefriars, adjacent to the Temple, then well known by the cant name of *Alautin*, had at this time, and for nearly a century afterwards, the privilege of a *sanctuary*, unless against the writ of the Lord Chief Justice. The place abounded with desperadoes of every description—bankrupt citizens, ruined gamblers, irreclaimable prodigals. *Scott*, *Fortunes of Nigel*, xvi.

3. Refuge; shelter; protection; specifically, the immunity from the ordinary operations of law afforded by the sacred character of a place, or by a specially privileged church, abbey, etc.

Irving, Knickerbocker, p. 197.

Sanctus (sang'k'tus), *n.* [So called from the first word in the *L.* version; < *L. sanctus*, pp. of *sancire*, make holy, consecrate: see *saint*.] 1. In *liturgies*, the ascription "Holy, holy, holy, Lord God of hosts, . . ." in which the eucharistic preface culminates, and which leads up to the canon or prayer of consecration. The *Sanctus* exists and occupies this place in all *liturgies*. It is probably of primitive origin, and was already, as it still is, used in the Jewish liturgy (being taken from Isa. vi. 2, 3: compare Rev. iv. 8), the following "Hosanna" (Psalm cxviii. 25, "Save now") also further marking the connection. A similar ascription occurs in the Te Deum. Other names for the *Sanctus* are the *Tersanctus* (and, improperly, the *Trisagion*), and the *Seraphic* or *Triumphal Hymn* (*Epiphonia*). See *Benedictus*, *preface*.

2. A musical setting of the above ascription or hymn.—**Black Sanctus**, a profane or burlesque hymn, performed with loud and discordant noises; hence, any confused, tumultuous uproar. Also *Black Santus*, *Santos*, *Santis*.
At the entrie we heare a confused noise, like a *blacke sanctus*, or a house haunted with spirits, such hollowing, shouting, dauncing, and clinking of pots.

sand¹ (sand), *n.* [*ME. sand, sond*, < *AS. sand* = *OS. sand* = *OFries. sond* = *MD. sand*, *D. zand* = *MLG. sant*, *LG. sand* = *OHG. MHG. sant*, *G. sand* = *Icel. sandr* = *Sw. Water-worn detritus, finer than that to which the name *gravel* would ordinarily be applied; but the line between sand and gravel cannot be distinctly drawn, and they frequently occur intermingled. Sand consists usually of the debris of crystalline rocks, and quartz very commonly predominates in it, since this mineral is very little liable to chemical change or decomposition. In regions of exclusively calcareous rocks there is rarely any considerable amount of what can be properly called *sand*, finely comminuted calcareous materials being extremely liable to become re-consolidated. Sand occurs in every stage of wear, from that in which the particles have sharp edges, showing that they have been derived from the recent breaking up of granitic and other silicious rocks, to that in which the fragments are thoroughly rounded, showing that they have been rubbed against one another during a great length of time. Sand, when consolidated by pressure or held together by some cement, becomes sandstone; and a large part of the material forming the series of stratified rocks is sandstone.

The counter, shelves, and floor had all been scoured, and the latter was overstrewn with fresh blue sand.

Hawthorne, Seven Gables, ii.

2. A tract or region composed principally of sand, like the deserts of Arabia; or a tract of sand exposed by the ebb of the tide: as, the *Libyan Sands*; the *Solway sands*.

5. Sandstone: so used in the Pennsylvania petroleum region, where the various beds of petro-liferous sandstone are called *oil-sands*, and designated as first, second, third, etc., in the order in which they are struck in the borings. Similarly, the gas-bearing sandstones are called *gas-sands*.—6. *pl.* The moments, minutes, or small portions of time; lifetime; allotted period of life: in allusion to the sand in the hour-glass used for measuring time.

See *Wealden*.—**New sand.** See *new*.—**Old sand.** In *founding*, sand which has been used for the molds of castings, and which has become, under the action of heat, friable and more porous, and is therefore used for filling the flasks over the facing sand, as it affords ready escape for gases.—**Rope of sand.** See *rope*.—**Sand blast.** See *sand-blast*.—**Sharp sand.** sand the particles of which present sharp crystalline fracture, not worn smooth by attrition.

The most important species is *S. album*, an evergreen 20 or 30 feet high, with the aspect of privet. It is native in dryish localities in southern India, ascending the mountains to an altitude of 3,000 feet. The heart-wood is yellowish-brown, very hard and close-grained, scented with an oil still more abundant in the root, which is distilled for perfumery purposes and is in great request. The wood is much used for carving, making ornamental boxes, etc., being valued as a protective from insects as well as for its perfume. It is also extensively used, especially in China (which is the great market for sandalwood), to burn as incense, both in temples and in dwellings. Other sandalwoods, from which for a time after their discovery large supplies were obtained, are *S. Freycinetianum* (its wood called *citron* or *yellow sandalwood*) and *S. pyrularium* of the Hawaiian Islands, *S. Yasi* of the Fijis, *S. sand-jet (sand'jet), *n.* An apparatus whereby sharp sand is fed to a jet of compressed air or a steam-jet, and driven out forcibly against a surface which it is desired to abrade. It has within a few years been extensively applied to the ornamentation of glass, and to some extent in the operations of stone-cutting and the smoothing and cleaning of cast-iron hollow ware. In the ornamentation of glass, stencils are placed upon the surface, which protect from abrasion the parts covered, and the abraded parts take the form of the pattern cut in the stencil. A very short exposure to the sand-jet produces the tracing of the pattern in a fine-frosted, well-defined figure. The effectiveness of the jet when air or steam at high pressure is used renders it competent to cut and drill even corundum. The results attained, when the simplicity of the means employed are considered, render this one of the most interesting of modern inventions. See *sandblast*.

Its special characters are a tubular disk sheathing the ovary and the base of the style, a cup-shaped calyx adnate to the base of the ovary, having five short imbricated lobes, a stamen-tube bearing at the apex ten included anthers, a corolla of five free imbricated petals, and a globose fleshy indehiscent fruit which is acid and edible. *S. Indicum*, native in Burma (there called *thit*) and introduced into southern India, is a lofty evergreen with a red close-grained heart-wood which takes a fine polish. It is used for making carts, boats, etc. This and perhaps other species have been called *sandal-tree*.

sandpiper (sand'pi'pér), *n.* 1. A small wading bird that runs along the sand and utters a piping note; a sand-lark, sand-plover, or sand-snipe. Technically—(a) A bird of the family *Scolopacidae*, subfamily *Scolopacinae*, and section *Tringae*, of which there are about 20 species, of all parts of the world. They have the bill like a true snipe's in its sensitiveness and constricted gape, but it is little if any longer than the head, straight or scarcely decurved, and the tail lacks the cross-bars of that of most snipes and tattlers. The toes are four in number (excepting *Calidris*), and cleft to the base (excepting *Micropalama* and *Ereunetes*). The sandpipers belong especially to the northern hemisphere, and mostly breed in high latitudes; but they perform the most ex-

tensive migrations, and in winter are generally dispersed over the world. The sexes are alike in plumage, but the seasonal changes of plumage are very great. The sandpipers are probably without exception gregarious, and often flock the beaches in flocks of hundreds or thousands. They live preferably in open wet sandy places, not in swamps and fens, and feed by probing with their sensitive bills, like snipes. Among them are the most diminutive of waders, as the tiny sandpipers of the genus *Actodromas* called *stints*. The semipalmated sandpiper is no larger, but has basal webs; it is *Ereunetes pusillus* of America. The spoon-billed sandpiper, *Eurymorhynchus pygmaeus*, is another diminutive bird, of Asia and arctic America. The still-sandpiper has long legs and semipalmated feet; it is *Micropalama himantopus*. The broad-billed sandpiper is *Limicola pygmaea* or *platyrhyncha*, not found in America. The pectoral sandpiper, or grass-snipe, is *Actodromas maculata*, a characteristic American species

Grass-snipe, or Pectoral Sandpiper (*Tringa (Actodromas) maculata*).

of comparatively large size. Dunlins or purrs are sandpipers of the genus *Pelidna*. The curlew-sandpiper is *Anclochilus subarquatus*. The purple sandpipers are several species of *Argutella*, as *A. maritima*. The knot, canute, red or red-breasted, or ash-colored sandpiper, or robin-snipe, is *Tringa canutus*. (b) A bird of the same family and subfamily as the foregoing, but of the section *Totanae*, or tattlers, several but not all of which are also known as sandpipers, because they used to be put in the old genus *Tringa*. The common sandpiper of Europe, etc., is *Tringa* *goides* or *Actitis hypoleucos*, of which the common peewee or spotted sandpiper of the United States, *T. macularius*, is a close ally. Green sandpipers belong to the genus *Rhyacophilus*, as *R. ochropus* of Europe and *R. solitarius* of America. The wood-sandpiper of Europe is *Totanus glareola*. The fighting sandpiper is the ruff, *Machetes* or *Pavoncella pugnaz*. The buff-breasted sandpiper is a peculiar American species, *Tryngites rufescens* or *subruficollis*. The Bartramian sandpiper is *Bartramia longicauda* or *Actitis bartramius* of America. See the technical and special names, and cuts under *Bartramia*, *dunlin*, *Ereunetes*, *Eurymorhynchus*, *Micropalama*, *Rhyacophilus*, *ruff*, *sanderling*, *stint*, *Tringa*, *Tringoides*, and *Tryngites*.

A powerful water-jet with an annular nozzle inclosing a tube which is sunk in loose sand, and operates as an injector to lift the sand with the water which discharges back through the tube. This form is used in caissons for sinking bridge-foundations, and is sometimes called a *sand-ejector*. It is a modification of the jet-pump. The water, passing upward around the upper end of the suction-pipe, produces an upward draft or suction on the mingled sand and water below, drawing it upward and discharging it through d.

sandstone (sand'stön), *n.* [= *D. zandsteen* = *G. sandstein* = *Sw. Dan. sandsten*; as *sand* + *stone*.] A rock formed by the consolidation of sand. The grains composing sandstone are almost ex-

clusively quartz, this mineral resisting decomposition, and only becoming worn into finer particles as abrasion continues, while almost all other minerals entering into the composition of ordinary rocks are liable to dissolve and be carried away in solution, or be worn down into an impalpable powder, so as to be deposited as mud. Sandstones may contain also clayey or calcareous particles, or be cemented by so large a quantity of ferruginous or calcareous matter as to have their original character quite obscured. Hence varieties of sandstones are qualified by the epithets *argillaceous*, *calcareous*, *ferruginous*, etc.—**Berea sandstone**, a sandstone or grit belonging to the Carboniferous series, extensively quarried as a building-stone and for grindstones in Ohio and especially in the vicinity of Berea (whence the name).—**Caradoc sandstone**, a sandstone of Lower Silurian age, very nearly the geological equivalent of the Bala group in Merionethshire, Wales, and of the Trenton limestone of the New York geologists. The name was given by Murchison, from the locality of Caer Caradoc, in Shropshire, England.—**Flexible sandstone**. See *itacolumite*.—**Medina sandstone**, a red or mottled and somewhat argillaceous sandstone forming, according to the classification of the New York Survey, the base of the Upper Silurian series. It corresponds nearly to the Upper Llandovery of the English geologists. It is the "Levant" or No. IV. of the Pennsylvania Survey.

"A mountain of IV." is perhaps the commonest expression in American geology. These mountains are very numerous, being reiterated outcrops or reappearances and disappearances of the *Medina sandstone* as it rises and sinks in the Appalachian waves.

J. P. Lesley, Coal and its Topography, p. 59.

New Red Sandstone, a name formerly given in England to a great mass of strata consisting largely of red shales and sandstones and overlying rocks, belonging to the Carboniferous series. A part of the New Red Sandstone is now considered to belong to the Permian series, since the organic remains which it contains are decidedly Paleozoic in character. The upper division of these red rocks, although retaining to a very considerable extent the same lithological characters as the lower division, differs much from it in respect to the fossils it contains, which are decidedly of a Mesozoic type, and form a portion of the so-called Triassic series. The term *New Red Sandstone* is still used to some extent in England, and has been applied in the United States to the red sandstones of the Connecticut river valley, which are generally considered to be of Triassic age. See *Triassic*.—**Old Red Sandstone**, a name given in England, early in the history of geology, to a group of marls, sandstones, timestones, and conglomerates seen over an extensive area, and especially in Herefordshire, Worcestershire, Shropshire, and South Wales, cropping out from under the coal-measures and resting on the Silurian. These rocks were called *Old Red*, to distinguish them from a somewhat similar series overlying the Carboniferous, and designated as the *New Red Sandstone*. The name *Devonian* was given later by Sedgwick and Murchison to rocks occurring in Devon and Cornwall and occupying a stratigraphical position similar to that of the Old Red, and the name *Devonian* is now in general use throughout the world as designating that part of the geological series which lies between the Silurian and the Carboniferous. The name *Old Red Sandstone* has, however, been retained by English geologists to designate that peculiar type of the Devonian which is less distinctively marine than the Devonian proper, and which is characterized by the presence of numerous land-plants and ganoid fishes, as well as by the absence of unequivocally marine organisms. The areas in which these deposits were laid down are generally considered to have been lakes or inland seas. The Old Red Sandstone, as thus limited, seems to have been almost exclusively confined to the British Isles; and it is particularly well developed in Scotland, and also is of considerable importance in Ireland.—**Oriskany sandstone**, the name given by the New York Geological Survey to a group of strata lying between the Lower Helderberg group and the Canda-gaili grit, and considered by James Hall as forming the uppermost division of the Upper Silurian. In central New York it is chiefly a silicious sandstone, but is sometimes argillaceous; it extends west as far as Missouri, becoming more calcareous. *Spirifer arenosus* is a very characteristic fossil of this group over a wide area. It is No. VII. of the numerical designation of the Pennsylvania Survey, and the "Meridian" of H. D. Rogers's nomenclature.—**Pocono sandstone**, a very thick and persistent mass of sandstones and conglomerates underlying the Mauch Chunk Red Shale, and forming the base of the Carboniferous in Pennsylvania. It is No. X. of the numerical notation of the First Pennsylvania Survey, and the same as the "Vespertine" of H. D. Rogers.

The Pottsville conglomerate forms a rim around the coal basins, and the *Pocono sandstone* and conglomerate an outer rim, with a valley included between them eroded out of the Mauch Chunk red shale.

C. A. Ashburner, Anthracite Coal-fields of Penn., p. 13.

Potsdam sandstone, in *geol.*, the lowest division of the Lower Silurian, and the lowest zone in which distinct traces of life have been found in the United States: so named by the geologists of the New York Survey from a town of that name in that State. The formation is a conspicuous and important one further west through the region of the Great Lakes. It is the equivalent of the Primordial of Barrande, and of the Cambrian or Cambro-Silurian of some geologists. Among the fossils which characterize this formation are certain genera of brachiopods (*Lingulella*, *Obolus*, *Orthis*, *Discina*) and trilobites of the genera *Conocoryphe* and *Paradoxides*. The Potsdam, Primordial, or Cambrian rocks have been variously subdivided in Europe and America within the past few years. Thus, the Canadian geologists call the lower section, as developed in Newfoundland, Nova Scotia, and New Brunswick, *Acadian*, and the overlying beds *Georgian*. In Nevada five divisions have been made out. The rocks thus designated, however, are paleontologically closely related; neither is there, in the opinion of most Continental geologists, any sufficient reason for separating the Cambrian, as a system, from the Silurian.—**St. Peter's sandstone**, a sandstone, from 60 to 100 feet in thickness, consisting of almost chemically pure silicious material, which lies next above the so-called Lower Magnesian limestone in the upper Mississippi lead region,

and extends further to the north into Minnesota. It is almost entirely destitute of fossils, but from its stratigraphical position it is considered to be nearly of the same age as the Chazy limestone of the New York Survey.

sand-sucker (sand'suk'ér), *n.* 1. The rough dab, *Hippoglossoides limandoides*, also called *sand-fluke* and *sandnecker*. The name is due to the erroneous idea that it feeds on nothing but sand. *Day, Fishes of Great Britain and Ireland*, II. 10.

2. In the United States, a general popular name for soft-bodied animals which hide in the sand, sometimes exposing their suckers, tentacles, or other parts, as ascidians, holothurians, or nereids.

sand-swallow (sand'swol'ô), *n.* Same as *bank-swallow*.

sand-thrower (sand'thrô'ér), *n.* A tool for throwing sand on sized or painted surfaces. It consists of a hollow handle in which a supply of sand is contained, and from which it passes into a conical or V-shaped box. The box ends in a narrow slit from which the sand issues, distributed by a projecting lip.

sand-trap (sand'trap), *n.* In *hydraul. engin.*, a device for separating sand and other heavy particles from running water. It consists substantially of a pocket or chamber in which the sand is collected by a sudden change in the direction of the flow, which causes the momentum of the particles to carry them out of the stream into the collecting-chamber, or by a sudden reduction of velocity through an abrupt enlargement in the pipe or channel which conducts the stream, whereby the heavy particles are permitted to gravitate into the receiving-pocket, or by the use of a strainer which intercepts the particles and retains them, or by a combination of these principles.

Sand-trap (in section).

There are many species, and the name is a loose one. Some of these wasps belong to the *Scoliidæ*; others, as of the family *Crabronidæ*, are also known as *sand-hornets*, and many are popularly called *sand-bugs*. The general distinction of these wasps is from any of those which build their nests of paper tissue, or which make their cells above ground. See cuts under *Ammophila*, *Crabro*, *Elis*, and *digger-wasp*, and compare *potter-wasp*.

sand-whirl (sand'hwér), *n.* A whirlwind whose vortex is filled with dust and sand. See *sand-spout*.

sandwich (sand'wich), *n.* [Named after John Montagu, 4th Earl of Sandwich (died 1792), who used to have slices of bread with ham between brought to him at the gaming-table, to enable him to go on playing without intermission. The title is derived from *Sandwich*, < ME. *Sandwiche*, AS. *Sandwic*, a town in Kent, < sand, sand, + wic, town.] 1. 'a sitting together,' < *σύν*, together, + *ἐδρα*, a seat, = *E. settle*.] 1. The supreme council and highest ecclesiastical and judicial tribunal of the Jewish nation. It consisted of 71 members, composed of the chief priests, elders, and scribes, and held daily sessions, except on sabbaths and festivals: specifically styled the *great sanhedrim*, to distinguish it from the *lesser* or *provincial sanhedrim* of 23 members appointed by the great sanhedrim, and having jurisdiction over minor civil and criminal cases. Such lesser tribunals were set up in towns and villages having not fewer than 120 representative men, including a physician, a scribe, and a schoolmaster. The great sanhedrim is said in the Talmud to have had its origin in the appointment by Moses of 70 elders to assist him as magistrates and judges (Num. xi. 16). The Greek origin of the name, however, seems to indicate that the thing originated during the Macedonian supremacy in Palestine. The name was dropped under the presidency of Gamaliel IV. (A. D. 270-300), while the institution itself became extinct on the death of its last president, Gamaliel VI. (425).

genus of monocotyledonous plants of the order *Hæmodoraceæ* and tribe *Ophiopogoneæ*. It is characterized by a long and slender perianth-tube, six filiform filaments, and a free ovary, fixed by a broad base, containing three cells and three erect ovules. There are about 10 species, natives of tropical and southern Africa and of the East Indies. They are plants of singular aspect, the true stem reduced to a short and thick rootstock from which spring long, thick, rigid, and sometimes cylindrical leaves, which are erect or spreading, resemble stems, and are filled with tough fibers. The flowers are of moderate size or sometimes very long, and are clustered among dry bracts in a dense raceme on a tall and stout unbranched leafless flower-stalk. This genus is the source of the fiber known as *bowstring hemp*, so named from a native use in India. (See *moorra*.) African bow-string hemp is the similar product of *S. Guineensis*.

The ancient and sacred language of India, being that in which most of the vast literature of that country is written, from the oldest parts of the Vedas (supposed to date from about 2000-1500 B. C.) downward. It is one of the Indo-European or Aryan family of tongues, a sister of the Persian, Greek, Latin, Germanic, Slavonic, and Celtic tongues. The earliest Sanskrit of the Vedas differs considerably from that of the later literature. Though Sanskrit has long ceased to be a vernacular language, it continues to be employed, in its later form, for literary purposes, much as Latin continued and continues to be used as a learned tongue. Abbreviated *Skt.*

It is characterized by a one-celled inferior ovary with one, two, or three ovules, pendulous from the summit of a slender erect stalk or funiculus, and by a green or colored perianth of one row, commonly of four or five valvate lobes with as many stamens, and a flat, ring-like, or sheathing disk. The fruit is a nut or more often a drupe, the exocarp either thin and dry or fleshy, or sometimes thick, the nut or stone containing a roundish smooth, wrinkled, or deeply furrowed seed. The species are either trees, shrubs, or low herbs, a few parasitic on branches or on roots. They are distinguished from the allied *Loranthaceæ* by the structure of the ovary, as well as their habit, which still more strikingly separates them from the *Balanophoraceæ*. There are about 200 species, distributed in 28 genera and 4 tribes, widely dispersed in tropical and temperate regions throughout the world. The leaves are alternate or opposite, smooth and entire, with the veins obscure, or sometimes all reduced to mere scales. The flowers are small or rarely conspicuous, green or yellowish, less often orange. Three genera extend into the United States—*Comandra*, *Pyrolaria*, and *Buckleya*. The flowers are perfect, marked by parallel anther-cells which open lengthwise, by a sheathing disk produced into distinct fishy scales, and by a bill-shaped or ovoid perianth, its tube adherent to the base of the ovary, the limb deeply divided into usually four valvate lobes, the stamens, together with clusters of hairs, borne on their base. The 8 species are native from the East Indies to Australia and the Pacific Islands. They are smooth plants, bearing opposite or rarely alternate petioled coriaceous leaves, which are feather-veined, but with the midrib alone conspicuous. The flowers are borne in the upper axils or in short loose terminal panicles trichotomously branching, and are followed by roundish drupes crowned by the ring-like scar of the fallen perianth. For species, see *sandalwood* (with cut).

The juice or fluid which circulates in all plants, being as indispensable to vegetable life as is the blood to animal life. It is the first product of the digestion of plant-food, and contains the elements of vegetable growth in a dissolved condition. The absorption of nutriment from the soil is effected by the minute root-hairs and papillae, the absorbed nutriment being mainly composed of carbonic acid and nitrogenous compounds dissolved in water. This ascending sap, or as it is termed *crude sap*, is apparently transmitted through the long cells in the vascular tissue of the stem and branches to the leaves, passing from cell to cell by the process known as *endosmosis*. In the leaves is effected the process of digestion or assimilation, with the following results: (1) the chemical decomposition of the oxygenated matter of the sap, the absorption of carbon dioxide (carbonic acid), and the liberation of pure oxygen at the ordinary atmospheric temperature; (2) a counter-operation by which oxygen is absorbed from the air, and carbon dioxide exhaled; (3) the transformation of the remaining crude sap into organic substances which enter into the composition of the plant: this change is effected in the chlorophyll-cells of the leaves under the influence of light, and the assimilated sap, or as it is termed *elaborated sap*, descends through the branches and stem to the growing parts of the plant requiring the same, there to be used up, after undergoing a series of changes included under the name *metabolism*, or to form deposits of reserve material lodged in various parts for future use. The ascent of the sap is one of the most wonderful phenomena of spring, and apparently depends not so much on the state of the weather—for it begins in the depth of winter—as on the plant having had its sufficient term of rest, and being, therefore, constrained by its very nature to renewed activity. Hence—2. The juice or fluid the presence of which in anything is characteristic of a healthy, fresh, or vigorous condition; blood.

A handkerchief; which say to her did drain The purple sap from her sweet brother's body.

Shak., Rich. III., iv. 4. 277.

The single sap has only a single parapet; the double has one on each side. A sap is usually made by four men working together.

The genuine sardine of the Mediterranean and the Atlantic coasts of Spain, Portugal, and France is the pilchard, *Clupea pilchardus*, highly esteemed for its delicate flavor. The Californian sardine is *C. sagax*, called *sadina*. An-

Californian Sardine (*Clupea sagax*).

other is the Spanish sardine, *C. pseudohispanica*, found from Cuba to Florida, and related to the former, but having a strongly striate operculum. In the French preparation of sardines these delicate fish are handled as fresh as possible, to which end the factories are usually within two or three hours from the place where the fish are caught. Placed on stone tables, the fish are headed and gutted: they are then allowed to drain on wooden slats overnight, after being slightly salted. Next day they are salted again, and allowed to dry. They are then cooked in oil, and put in wire baskets to drip. The cooking is a nice process; if it is overdone the scales come off, which impairs the market value. Five or six minutes suffices for the cooking. When cold the fish are placed on tables, to be arranged in the boxes, in oil dipped from barrels. The oil being worth more than the fish, bulk for bulk, it is an object to fill the boxes as closely as possible with fish. The boxes are then

soldered and afterward steamed, being placed in cold water on which steam is gradually turned. This second cooking takes an hour or more. The boxes are then allowed to cool in the water, and care is taken to move them as little as possible. In a cheaper method the sardines are first cooked in an oven without oil, the after-process being the same as before. As the fish are migratory, a shoal sometimes remains at a fishing-station only a week. The season of catching and canning lasts three or four months, from May to August. Small sardines are most prized. Large coarse fish put up in the United States as sardines, under the name of *shadines*, are young menhaden.

When the said increasing of the sea commeth, there commeth also therewith such a multitude of the smaule fysshes cauled *sardynes* that . . . no man wolde beleue it that hath not seene it.

The weed has also been called in *E.* *grapeweed* and *tropical grapes*.] Same as *gulfweed*. The *Sargasso Sea* is a region occupying the interior of the great gyration of the Gulf Stream in the North Atlantic, so named from the abundance in it of this weed (*Sargassum bacciferum*), which in some parts is so dense as to be a serious hindrance to navigation. It covers a large part of the space between the 16th and 38th parallels of north latitude, and the seaweed is most dense between the 30th and 50th meridians. By extension the name is sometimes used with reference to other less important areas of floating seaweed. See *Sargassum*.

The floating islands of the gulf-weed, with which we had become very familiar as we had now nearly made the circuit of the *Sargasso Sea*, are usually from a couple of feet to two or three yards in diameter, sometimes much larger; we have seen on one or two occasions fields several acres in extent, and such expanses are probably more frequent nearer the centre of its area of distribution.

It is characterized by flowers with five thick and spreading sepals, five petals curving together, numerous short stamens, and a large five-lobed and five-celled ovary with its distinct style dilated at the

top into a peltate umbrella-like and petaloid membrane, which is stigmatic near the end of a nerve extending to each of its five angles. The 8 species are all natives of North America, and occur chiefly in the southern United States, with one also in the northern. They are remarkable plants, inhabiting peat-bogs, with their leaves transformed into pitchers, and produced at the top into a more or less arching hood, which closes the pitcher when young. The pitchers are usually partly filled with rain-water and with masses of decomposing insects, and in some species special glands secrete a digestive fluid which aids in their assimilation. The flowers are large, solitary, and nodding upon a long leafless scape, usually of a deep brownish red, globular in the bud, flattened on expansion, and with petals which are strongly contracted in the middle. *S. purpurea*, the original species, which extends north to Great Bear Lake, is known as *pitcher-plant*, also as *hunterman's cup* and *sidesaddle-flower*. *S. flava* and other southern species are known as *trumpet-leaf* and *hunterman's horn*.

Sarraceniaceæ (sar-a-sē-ni-ä'sē-ē), *n. pl.* [NL. (Endlicher, 1836), *< Sarracenia + -aceæ.*] An order of polypetalous plants of the cohort *Parietales* in the series *Thalamifloræ*. It is characterized by a minute embryo near the base of the seed in fleshy albumen, and flowers with five sepals and five petals, numerous stamens, and a five- or three-celled ovary with the placentæ fixed to the inner angle. They are readily distinguished by their peculiar habit, being bog-plants with conspicuous flowers nodding upon naked scapes, surrounded at the base by a circle of radical leaves, which are inflated into pitchers, and project in front into a thin lamina, and at the top into a hood. The 10 species are all American, and belong mainly to the type genus, *Sarracenia*—the others, *Darlingtonia* and *Heliamphora*, being monotypic. See cuts under *Darlingtonia* and *pitcher-plant*.

sasin (sas'in), *n.* [E. Ind.] The common Indian antelope, *Antelope cervicapra* or *A. bezoartica*, remarkable for its swiftness and beauty.

Sasin, or Indian Antelope (*Antelope cervicapra*).

It is abundant in the open dry plains of India, in flocks of from ten to sixty females to a single male. It will clear from 25 to 30 feet at a bound and rise even 10 or 11 feet from the earth. It is grayish-brown or black on the upper parts of the body, with white abdomen and breast, and a white circle round the eye. It stands about 2 feet 6 inches high at the shoulder. This is the animal which is considered to represent the modern restricted genus *Antelope*, from which many more have been successively detached for other and very numerous *Antilopinae* of Asia and Africa. Its usual specific name is not to be confounded with the same word used in a generic sense for the very different African bohor. The sasin is among several antelopes loosely called *algazel*. It has long been known as a source of bezoar, as indicated by one of its specific names. The record of the sasin, in its relations to man, goes back to the dawn of history; for it is the animal with the straight corkscrew horns so commonly figured on the monuments of Assyria and Babylonia. In India it is usually figured drawing the car of Chandra, the moon-god, and furnishes a probable prototype of the animals with which the classic huntress Diana is associated. It is there also a regular attribute of Shiva, or Mahadeva, held by the hind legs upright in one of the hands of this god, and connected with linga-worship, apparently from its reputed salacity.

withers, and its horns are gently curved rather than abruptly bent. It is one of the group of large bubaline antelopes of which the blebok is another, but the sassaby lacks the white blaze on the face. (Compare cut of *blebok*.) The horns are about a foot long. The animal is much hunted both for its hide and for its flesh, and has been thinned out in countries where it formerly abounded. It inhabits by preference open places, sometimes in herds of several hundreds.

It reaches a height of about 45 feet. Its wood is light and soft, coarse-grained, not strong, but very durable in contact with the soil, used for fencing, in cooperage, etc. The root, especially its bark, enters into commerce as a powerful aromatic stimulant, and is much used in flavoring and scenting, an oil being distilled in large quantities for the latter purpose. The bark is official, as also the pith, which affords a mucilaginous application and a drink. An early name in England was *ague-tree*.

The only species, *S. officinale*, is a native of the United States, especially southward and principally east of the Mississippi, extending also into Canada. It is a small or middle-sized tree, with aromatic bark and roots, and remarkable for the green color of its flowers, bud-scales, and branches, and for its dimorphic leaves, the earlier entire and oval, the later three-lobed or irregular. 3. In *geom.*, a straight line bearing the following relation to another straight line. The *satellite* (also called the *satellite line*) of a given straight line, with reference to a given cubic curve in whose plane the straight line lies, is the straight line joining the three points at which the three tangents to the curve at the points of intersection of the first straight line with it again cut the curve. This is the definition of Cayley (Phil. Trans., 1857, p. 416), but it has the inconvenience that according to it every *satellite line* has two, four, or six primaries, while each primary has but a single *satellite*. For this reason, it might be well to interchange the applications of *primary* and *satellite* in the theory of plane cubics. In the diagram, ABC is the *satellite line*.

The intersections of these with the *satellite line* are called the *satellite points*. Two are near H. The others are not shown.

Leave dangerous truths to unsuccessful *satires*.

Pope, Essay on Criticism, l. 592.

= *Syn.* 1. *Pasquinade*, *Invective*, etc. See *lampoon*.—2. *Irony*, *Sarcasm*, *Satire*, *ridicule*. *Irony* may be of the nature of *sarcasm*, and *sarcasm* may possibly take the form of *irony*; but *sarcasm* is generally too severe, and therefore too direct, to take an ironical form; both may be means of *satire*. The essential thing about *irony* is the contradiction between the literal and the manifest meaning: as, "Is not a patron, my lord, one who looks with unconcern on a man struggling for life in the water, and when he has reached the ground, encumbers him with help?" (*Johnson*, To *Chesterfield*.) "*Irony* . . . is the humorous wresting of language from its literal use for the expression of feeling, either happy or painful, but too vehement to be contented with that literal use. . . . When the thoughtful spirit of *Macbeth* is distorted by guilt, and as the agony of that guilt grows more and more intense, the pent-up misery either flows forth in a subdued *irony* or breaks out in that which is fierce and frenzied." (*H. Reed*, Eng. Lit., p. 366.) The essential thing about *sarcasm* is its cutting edge; it therefore is intensely concentrated, lying in a sentence or a phrase; it is used to scourge the follies or foibles or vices of men, but has little of reformatory purpose. *Satire* is more elaborate than *sarcasm*, is not necessarily bitter, and has, presumably, some aim at the reformation of that which is satirized. "Well-known instances of ironical argument are *Burke's* 'Vindication of Natural Society,' in which *Bolingbroke's* arguments against religious institutions are applied to civil society; *Whately's* 'Historic Doubts,' in which *Hume's* arguments against Christianity are used to prove the non-existence of *Napoleon Bonaparte*; *Swift's* 'Argument against the Abolishment of Christianity,' and his 'Modest Proposal' for relieving Ireland from famine by having the children cooked and eaten." (*A. S. Hill*, Rhetoric, p. 193.)

saturation (sat'ū-rā'shon), *n.* [*< F. saturation* = Sp. *saturación* = Pg. *saturação* = It. *saturazione*, < LL. *saturatio* (n-), a filling, saturating, < L. *saturare*, fill, saturate: see *saturate*.] The act of saturating or supplying to fullness, or the state of being saturated; complete penetration or impregnation. Specifically—(a) In chem., the combination or impregnation of one substance with another in such proportions that they neutralize each other, or till the receiving substance can contain no more. The saturation of an alkali by an acid is effected by chemical combination; the saturation of water by salt is by the process of solution. A fluid which holds in solution as much of any substance as it can dissolve is said to be saturated with it; but saturation with one substance does not deprive the fluid of its power of acting on and dissolving some other substances, and in many cases it increases this power. For example, water saturated with salt will still dissolve sugar. (b) In physics: (1) With respect to the presence of a vapor, a space is said to be in a state of saturation when it contains all that it can hold at that temperature; the vapor is also said to be in a state of saturation or at the dew-point (see *vapor*); it has then a maximum elastic pressure for the given temperature, and is in a state where any increase of pressure or lowering of temperature will cause it to be more or less condensed to a liquid state. (2) With respect to the presence of magnetism, a bar is said to be magnetized to saturation when a maximum of permanent magnetic force has been imparted to it, this maximum depending principally upon the material of which the bar is made.—**Saturation-equivalent**, in chem., a number expressing the quantity of a standard solution required to saturate or neutralize the standard quantity of a substance, as of a fatty acid.—**Saturation of colors**, in optics, the degree of admixture with white, the saturation diminishing as the amount of white is increased. In other words, the highest degree of saturation belongs to a given color when in the state of greatest purity.

saturation-pressure (sat'ū-rā'shon-presh'ūr), *n.* The pressure (fixed for a given vapor at a given temperature) which is required to bring it to its maximum density.

The *saturation-pressure* of any vapour at any temperature is the same as the pressure at which the corresponding liquid boils at that temperature.

Satureia (sat'ū-rē-i-ū), *n.* [NL., < L. *saturcia*, savory: see *saturege*, *savory*².] A genus of gamopetalous plants, of the order *Labiata*, type of the tribe *Satureieae*, and belonging to the subtribe *Menthoidæ*. It is characterized by four distant and ascending stamens, an open bell-shaped calyx with five equal teeth and ten equidistant nerves, and a corolla-tube which equals the calyx and bears a spreading and three-cleft lower lip and an erect flat and entire upper lip. There are about 15 species, natives of the Mediterranean region, excepting one, *S. rigida*, which occurs in Florida. They are strongly aromatic herbs or undershrubs, with small entire leaves, often clustered in the axils, and flower-clusters or verticillasters either loosely few-flowered or densely many-flowered and globose or aggregated into a head, in the American species into a dense spike. See *savory*, the popular name of the genus.

Satureineæ (sat'ū-rē-in'ē-ē), *n. pl.* [NL. (Endlicher, 1836), < *Satureia* + *-inæ*.] A tribe of gamopetalous plants of the order *Labiata*, characterized by a four-parted ovary forming four smooth dry nutlets in fruit, and by flowers with the calyx-nerve thirteen or less, the corolla-lobes usually flat, and the stamens four, or sometimes two, and either straight and diverging or ascending. It includes about 42 genera, classed in 4 subtribes. They are shrubs or usually herbs, very strongly pervaded by the odor of mint, the flowers often but slightly labiate. For important genera, see *Satureia* (the type), *Mentha* (type of the family), *Collinsonia*, *Cunila*, *Lycopus*, and *Pycnanthemum*, prominent in the eastern United States, and *Thymus*, *Melissa*, *Hedeoma*, *Hyssopus*, *Calamintha*, *Origanum*, and *Perilla*, important genera of the Old World. Saturn (sat'ern), *n.* [*< ME. It. *Saturno*; < L. *Saturnus*, Saturn; prob. < *serere*, pp. *satus*, sow: see *sation*, *season*.] 1. An ancient Italic deity, popularly believed to have appeared in Italy in the reign of Janus, and to have instructed the people in agriculture, gardening, etc., thus elevating them from barbarism to social order and civilization. His reign was sung by the poets as "the golden age." He became early identified with the Kronos of the Greeks. Ops, the personification of wealth and plenty, was his wife, and both were the especial protectors of agriculture and of all vegetation. His festivals, the *Saturnalia*, corresponded to the Greek Kronia.

2. The most remote of the anciently known planets, appearing at brightest like a first-magnitude star. It revolves in an orbit inclined 2½° to the ecliptic, departing toward the north by that amount near Spica, and toward the south in the ribbon of the Fishes. Its mean distance from the sun is 9.5 times that of the earth, or 883,000,000 miles. Its sidereal revolution occupies

The Planet Saturn, with its Ring.

Julian years and 167 days, its synodical 378 days. The eccentricity of the orbit is considerable, the greatest equation of the center being 6'.4. Owing to the fact that the period of Saturn is very nearly 2½ times that of Jupiter, these planets exercise a curious mutual influence, analogous to that of one pendulum upon another swinging from the same support. Since 1790, when in consequence of this influence Saturn had lagged 50' behind and Jupiter had advanced 20' beyond the positions they would have had if undisturbed, Saturn has been moving continually faster, and the whole period of the inequality is 929 years. This is the largest perturbation of those affecting the motions of the principal bodies of our system. Saturn is the greatest planet except Jupiter, its diameter being about 9 times, its volume 697 times, and its mass 93.0 times that of the earth. Its mean density is 0.7, water being unity. Gravity at the surface has 1½ the intensity of terrestrial gravity. It is evident that we see only the atmosphere of Saturn. Its albedo is 0.5, about that of a cloud; but its color is decidedly orange. It shows some bands and spots upon its surface which are not constant. The compression of the spheroid of Saturn exceeds that of every other planet, amounting to ¼ of its diameter. Its rotation, according to Professor Asaph Hall, is performed in 10h. 14m. Its equator is nearly parallel to that of the earth. After the discovery by Galileo of the four satellites of Jupiter, Kepler conjectured that Mars should have two, and Saturn six or eight moons. In fact, Saturn has eight moons, as follows (the distances from the planet being given in thousands of miles):

| Name. | Mag. | Dist. | Period. | Discoverer. | Date. |
|-----------|------|-------------|---------------|---------------|-------|
| | | d. h. m. s. | | | |

Saturn was regarded by astrologers as a cold, dry, and melancholy planet, and was called the *greater infortune*. The symbol of Saturn is ♄, representing probably a scythe. For its attendant ring, see below.

3†. In *alchemy* and *old chem.*, lead.—4. In *her.*, a tincture, the color black, when blazoning is done by means of the heavenly bodies. See *blazon*, n., 2.—**Balsam of Saturn**, line of Saturn, mount of Saturn, salt of Saturn. See *balsam*, line2, etc.—**Saturn red**, red lead.—**Saturn's ring**, an apparent ring around and near the planet Saturn. It consists of three apparent rings lying in one plane. The innermost is dusky and pretty transparent. In contact with it is the brightest ring, called ring B, and between this and the outermost, called ring A, is a gap. Other divisions have been observed at different times, but they do not appear to be constant. The following are the dimensions in statute miles:

| | |
|---|---------|
| Diameter of Saturn | 75,800 |
| Distance from surface of Saturn to dusky ring | 5,900 |
| Breadth of dusky ring | 11,200 |
| Breadth of ring B | 17,900 |
| Width of division | 1,800 |
| Breadth of ring A | 11,700 |
| Total diameter of ring | 172,800 |

The thickness of the ring is considerably less than a hundred miles. Its plane is inclined 7° to the planet's equator and 28° 10' to the earth's orbit. When Saturn appears in the hind legs of Leo or the water of Aquarius, we see the rings edgewise, and they pass out of sight, remaining invisible as long as the sun shines upon the side away from us, for the ring only shows by the reflected light of the sun. They are best seen when the planet is in Taurus or Scorpio. As soon as Saturn was examined with a telescope (by Galileo), it was seen to present an extraordinary appearance; but this was first recognized and proved to be a ring by Huygens in 1659. In 1674 J. D. Cassini saw the separation between rings A and B, which is hence called the Cassinian division. (It has also been erroneously called Ball's division.) The dusky ring was discovered in 1850 at Cambridge, Massachusetts, by G. P. Bond. The ring was first assumed to be solid. Laplace showed that, upon that assumption, it must be upheld by the attractions of the satellites. B. Peirce in 1851 demonstrated the ring to be fluid—that is, to consist of vast numbers of particles, or small bodies, free to move relatively to one another. This had been suggested by Roberval in the seventeenth century. See cut on preceding page.—**Saturn's tree**, the popular name for an arborescent deposit of lead from a solution of lead acetate by electrochemical action.

2. Of or pertaining to the planet Saturn.—**Saturnian meter** or *verse*, a form of verse used in early Roman poetry before the adoption of Greek meters. A number of examples of this meter are extant in citations, inscriptions, etc., but recent metricians are by no means agreed as to its true nature. Some explain it as quantitative, and describe the classic example

Dábunt málum Metélli [or Metélli] || Návio poëtæ

as an iambic line consisting of two members (cola) separated by a cesura. Such a verse was compared by Macaulay (Introd. to "Lays of Ancient Rome") to the nursery rhyme

Thé queen | wás in | hër pàr | lour | éating | bread And | hónèy.

Others (and this is now the prevalent opinion) regard the Saturnian verse as purely accentual:

with small horns upon the forehead, and a tail like that of a horse or a goat, and they frequently hold a thyrsus or wine-cup. Late Roman writers confused the satyrs with their own fauns, and gave them the lower half of the body of a goat. Satyrs were common attendants on Bacchus, and were distinguished for lasciviousness and riot. In the authorized version of the Old Testament (Isa. xlii. 21; xxxiv. 14) the name is given to a demon believed to live in uninhabited places and popularly supposed to have the appearance of a he-goat (whence the name). The Hebrew word *śā'ir*, plural *śā'im*, so translated in these passages, means 'shaggy' as an adjective, and 'he-goat' as a noun. From the idolatrous worship of goats, the name came to be applied to demons. In Lev. xvii. 7 and 2 Chron. xi. 15 it is translated 'devil.'

a lizard: see *Saurus*.] An order of reptiles,
having scales and usually legs, named by Bron-
gniat in 1799, and corresponding closely to the
Linnean genus *Lacerta*; lizards. The name has
been used with various extensions and restrictions of its
original sense, in which it included the crocodiles and
alligators as well as the true lizards or lacertilians, thus
corresponding to the two modern orders *Lacertilia* and
Crocodylia. In Cuvier's classification *Sauria* were the
second order of reptiles, extended to include not only the
living lizards and crocodiles, but also the extinct repre-
sentatives then known of several other modern orders, as
pterosactyls, ichthyosaurs, and plesiosaurs. On these ac-
counts the term *Sauria* is discarded by many modern
writers; by others it is used in a restricted sense for the
lizards proper without the crocodiles, being thus an exact
synonym of *Lacertilia*. This is a proper use of the name,
near its original sense, and the term has priority over
Lacertilia. The *Sauria* in this sense are about 1,500 spe-

ard. Though the term *Sauria* once lapsed from any defi-
nite signification, in consequence of the popular applica-
tion of Cuvier's loose use of the word, *saurian* is still used
as a convenient designation of reptiles which are not am-
phibians, chelonians, ophidians, or crocodilians. See cuts
under *Plesiosaurus*.

'a cutter'), < *√ sag*, cut, = *L. secare*, cut (whence ult. *E. sickle*): see *secant, section*.] **1.** A cutting-tool consisting of a metal blade, band, or plate with the edge armed with cutting teeth, worked either by a reciprocating movement, as in a hand-saw, or by a continuous motion in one direction, as in a circular saw, a band-saw, and an annular saw. Saws are for the most part made of tempered steel. The teeth of the smaller kinds are formed by cutting or punch-

ing in the plate interstitial spaces or gullets. In saws of large size inserted or removable teeth are now much used. Small saws are generally provided with a single handle of hard wood; larger saws, for use by two workmen, have a handle at each end. Reciprocating saws more generally have their teeth inclined toward the direction of their cutting-stroke (see *rake*³, *n.* 1), but some cut in both directions equally. To cut freely, saws must have, for most purposes, what is called *set*—that is, alternate teeth must be made to project somewhat laterally and uniformly from opposite sides of the saw in order that the kerf or saw-cut may be somewhat wider than the thickness of the saw-blade. This prevents undue friction of the sides of the blade against the sides of the kerf. Some saws, however, as surgeons' saws, hack-saws, etc., have little or no set, and undue friction against the kerf is prevented by making the blades of gradually decreasing thickness from the edge toward the back.

2. A saw-blade together with the handles or frame to which the blade is attached, as a hand-saw, wood-saw, or hack-saw.—**3.** In *zool.* and *compar. anat.*, a serrated formation or organ, or a serrated arrangement of parts of formations or organs. (*c*) The long flat serrate or dentate snout of the saw-fish. See cut under *Pristia*. (*d*) The ovipositor of a saw-fly (*Tenthredinidae*).

4. A sawing-machine, as a scroll-saw or jig-saw.

5. The act of sawing or see-sawing; specifically, in *whist* [U. S.], same as *see-saw*, 3 (*b*).—

Annular saw. (*a*) A saw having the form of a hollow cylinder or tube, with teeth formed on the end, and projecting parallel to the longitudinal axis of the cylinder, around which axis the saw is rotated when in use. Also called *barrel-saw, crown-saw, cylinder-saw, drum-saw, ring-saw, spherical saw, and tub-saw*. See cut under *crown-saw*. (*b*) In *surg.*, a trephine.—**Brier-tooth saw**, a saw gulleeted deeply between the teeth, the gullets being shaped in a manner which gives the teeth a curvature resembling somewhat the prickles of briars (whence the name). This form of tooth is chiefly used in circular saws, rarely or never in reciprocating saws. Also called *gullet-saw*.—**Butcher's saw** [named after R. G. Butcher, a Dublin surgeon], a narrow-bladed saw set in a frame so that it can be fastened at any angle: used in resections.—**Circular saw**, a saw made of a circular plate or disk with a toothed edge, either formed integrally with the plate, or made by inserting removable teeth, the latter being now the most approved method for teeth of large lumber-cutting saws. Circular saws are very extensively used for manufacturing lumber, and their cutting power is enormous, some of them being over 7 feet in diameter, running with a circumferential velocity of 9,000 feet and cutting at the rate of 200 feet of kerf per minute. From the nature of this class of saws, they are exclusively used in sawing-machines. These machines, for small saws, are often driven by foot- or hand-power, but more generally by steam-, water-, or animal-power. Plain circular saws can cut only rectilinear kerfs, but some circular saws have a dish or concavo-convex form, by which curved shapes corresponding with the shape of the saw may be cut. See cut under *rim-saw*.—**Comb-cutters' saw**. Same as *comb-saw*.—**Cross-cut saw**. (*a*) A saw adapted by its filing and setting to cut across the grain. The teeth are filed to act more nearly like knife-points than those of rip-saws, which act more like chisels. (Cross-cut saws have a wider set than rip-saws. (*b*) Particularly, a saw used by lumbermen for cutting logs from tree-trunks, having an edge slightly convex in the cutting-plane, a handle at each end projecting from and at right angles with the back in the plane of the blade, and teeth filed so that the saw cuts when drawn in either direction. It is operated by two workmen, one at each handle.—**Double saw**, two parallel saw-blades working together at a specific distance from each other, and in cutting leaving a piece of specific thickness between their kerfs.—**Endless saw**. Same as *band-saw*.—**Equalizing saw**, a pair of circular saws placed on a mandrel and set at any desired distance apart by a gage: used for squaring off the ends of boards, etc.—**Hack-saw**, a small stout frame-saw with little set, close teeth, and well tempered: used for sawing metal, as in cutting off bolts, nicking heads of hand-made screws, etc.—**Half-back saw**, a hand-saw the back of which is stiffened to a distance of half the length of the blade from the handle.—**Half-rip saw**, a hand-saw without a back, and having a width of set intermediate between that of a cross-cut saw and that of a rip-saw.—**Hey's saw**, a small two-edged saw set in a short handle: one edge is straight, the other convex. It is used in removing pieces of bone from the skull.—**Interosseous saw**. See *interosseous*.—**Perforated saw**, a saw having a series of perforations behind the teeth.—**Pitch of a saw**. See *pitch*.—**Pit frame-saw**, a double frame-saw, worked by hand, to the frame of which are attached upper and lower cross-handles analogous to those used on the ordinary pit-saw.—**Railway cut-off saw**, a circular saw or buzz-saw supported on its frame upon a carriage moving on a track, so that it can be fed backward and forward to its work.—**Reversible saw**, a straight-edged saw having both edges armed with teeth, so that cutting can be done with either edge, at will, by reversing the saw.—**Smith's saw**, a hack-saw.—**To be held at the long saw**, to be kept in suspense.

Between the one and the other he was held at the long saw above a month.

Boxwood sawdust is considered the best for jewelry, be-
cause it is free from turpentine or resinous matter. That

ing, and, on account of its properties as a non-conductor
of heat, as filling in walls, etc.

ally wander beyond their ordinary limits. The European
species is *Pristis antiquorum*, the pristis of the ancients,
of the Atlantic Ocean, attaining a length of from 10 to 20
feet, and of a grayish color. The common American saw-

fish is *Pristis pectinatus*. The saw attains a length of a

the willow saw-fly, *Nematodes centricus*. The pear-slug is
the larva of *Selandria cerasi*. The wheat or corn saw-fly
is exceedingly injurious to wheat and rye, the female de-
positing her eggs in the stalk, which the larva destroys.
It is about half an inch long. The Scotch saw-fly is a mem-
ber of the genus *Lophyrus*. See cuts under *Hylotoma*,
Lyda, *rose-slug*, and *Securifera*.

In the case of the larch saw-fly (*Nematodes erichsonii*,
Hartig), the two sets of serrated blades of the ovipositor
are thrust obliquely into the shoot by a sawing movement;
the lower set of blades is most active, sliding in and out
alternately, the general motion of each set of blades being
like that of a back-set saw.

machine. See *lath*.—*Sawing-machine gage*. Same
as *saw-gage*.—*Traversing sawing-machine*, a sawing-
machine in which the work remains stationary, and the
saw travels over it.

saw-jointer (sà'join'tér), *n.* An apparatus by
which the jointing of gang-saws (that is, the
filing and setting of the teeth) is performed with
proper allowance for change of shape resulting
from unequal strains in the saw-gate, so that
parallelism of the breast-line and rake may be
secured when the saws are put under tension.

The main features of the apparatus are a guiding-frame
for holding the saw during the operation of jointing,
which moves upon adjustable ways in such manner as to
gage the filing of the teeth so that their points will lie in
the arc of a circle of considerable radius. Saws so jointed
may have the tension adjusted in the gate in a manner
that will secure the straight breast-line and uniform rake
necessary for uniformity in their action in the gang.

saw-tooth (sâ'tôth), *n.* A tooth of a saw. Saw-teeth are made in a great variety of forms; typical shapes are shown in the cuts.

If designed to cut in one direction only, they are given a rake in that direction. If they are to cut equally in either direction, the teeth are generally V-shaped, their right angles with the line of cut. Teeth of saws are either formed integrally with the plates or blades, or inserted and removable. The latter have the advantage that they can be replaced easily and quickly when worn or broken, and the need of gumming is entirely obviated. The method is, however, practicable only with the teeth of large saws.—**Saw-tooth indicator**, an adjustable device used in shaping the teeth of circular saws to insure their filing and setting at equal distances from the center.—**Saw-tooth swage**, an anvil-block used with a punch or wedge to flatten the edges of saw-teeth. The details of construction are such that the tone is remarkably full and even, the compass very long, and the fingering consistent and simple. Six or more sizes or varieties are made, so as to form a complete series or family of similar tone and manipulation; they are named by their fundamental key or by their relative compass, as soprano, tenor, etc. The tenor saxhorn is also called *alt-horn*; the next larger, *barytone*; the next, *euphonium*; and the bass, *bombardon* or *sax-tuba*. These instruments are especially useful for military bands, but they have not been often introduced into the orchestra, because of the comparatively unsympathetic quality of the tone. Also *saxcornet* and *saxotromba*.

Saxifraga (sak-sif'râ-gä), *n.* [NL. (Tournefort, 1700): see *saxifrage*.] A genus of polypetalous plants popularly known as *saxifrage*, type of the order *Saxifragaceae* and tribe *Saxifragae*. It is characterized by a two-celled ovary maturing into a small two-beaked and two-celled many-seeded pod, with the placenta in the axis, and by flowers with a five-lobed calyx, five equal petals, and ten stamens, with slender filaments and two-celled anthers. There are about 180 species, chiefly natives of cold regions, especially high mountains and in arctic latitudes, chiefly of the northern hemisphere, rare in South America and in Asia. They are usually perennials, with a radical rosette of broad leaves, and varying in habit from erect to prostrate, and from very smooth to glandular-hairy. Their flowers are small, but of conspicuous numbers, usually white or yellow, and panicle or corymbose. About 50 species are found in North America, nearly half of which occur also in the Old World; excluding Alaska, 30 species are known within the United States, natives especially of mountains of New England and Colorado, only 3 descending into the plains, and but 1 in the mountains south of North Carolina. They increase rapidly northward, and 25 or more are reported from Alaska, 9 of which extend to its most northern limit, Point Barrow, at 71° 27'. *S. oppositifolia*, the purple saxifrage, is perhaps the most characteristic and widely distributed plant of the arctic regions, where it is almost universal, and often the first flower to bloom, producing from four to nine pink or dark-purple petals, ranging from sea-level to 1,000 feet, and extending from northern Vermont to the farthest north yet reached, 83° 24'. See *saxifrage*.

Saxifragaceae (sak'si-frâ-gä-së-ë), *n. pl.* [NL. (A. P. de Candolle, 1830), < *Saxifraga* + *-aceæ*.] An order of polypetalous plants, the saxifrage family, belonging to the cohort *Rosales* in the series *Calyceifloræ*. It is closely allied to the *Rosaceae*, but with usually only five or ten stamens, and is characterized by the usual presence of regular flowers with five sepals, five petals, free and smooth filaments, two-celled anthers, a swollen or divided disk, and an ovary of two carpels, often separate above and containing numerous ovules in two rows at the central angle. It includes about 650 species in 87 genera of 6 tribes, natives of north temperate and especially of frigid regions, rare in the tropics and south temperate zone. It exhibits great variety in habit. In the shrubby genera and trees the leaves are generally opposite; in the others alternate, and often chiefly radical. Many produce valued fruits, as the currant and gooseberry; in others the fruit is a dry capsule. Many are cultivated for their ornamental flowers. See *Hydrangea*, *Deutzia*, *Philadelphus*, *Heuchera*, and *Saxifraga* (the type of the family); also *Ribes²*, *Cunonia*, *Escallonia*, *Francoa*, the types of tribes; and, for American genera, *Itea*, *Mitella*, *Parnassia*, and *Tiarella*. a stone, rock (prob. < *√ sac, sec*, in *secare*, cut: see *secant, saw¹*), + *frangere* (*√ frag*), break. = E. break: see *fragile*. Cf. *sassafras*.) A plant of the genus *Saxifraga*.

Scarcely any of the species have economic properties, but many are beautiful in foliage and flower. They are commonly rock-plants with tufted leaves and panicles of white, yellow, or red flowers. They are predominantly alpine, and of alpine plants they are the most easy to cultivate. One group, as *S. hypnoides*, has mossy foliage, forming a carpet, in spring dotted with white flowers. Others, as *S. aizoon*, have the foliage silvery, in rosettes. Others, as *S. umbrosa*, the London-pride or none-so-pretty, and *S. oppositifolia*, the purple saxifrage, afford brilliant colored flowers. A leathery-leaved group is represented by the Siberian *S. crassifolia*, well known in cultivation. A common house-plant is *S. armen-tosa*, the beefsteak- or strawberry-geranium (see *geranium*), also called *saxil-plant*, *creeping-saxil*, and *Chinese saxifrage*. *S. The few relics left us of this style exhibit its general characteristics as rude solidity and strength. The walls are of rough masonry, very thick, without buttresses, and sometimes of herring-bone work; the towers and pillars are thick in proportion to height, the former being sometimes not more than three diameters high; the quoins or angle-masonry are of hewn stones set alternately on end and horizontally (long and short work); the arches of doorways and windows are rounded, or sometimes these openings have triangular heads, their jambs of long and short work carrying either rudely carved impostes or capitals with square abaci. Sometimes heavy moldings run round the arches, and when two or more arches are conjoined in an arcade they are carried on heavy low shafts formed like balusters. Window-openings in the walls splay from both the interior and the exterior, the position of the windows being in the middle of the thickness of the wall. — **Saxon blue**. imitate different kinds of marble, the colors are mixed with the paste. Breccias are imitated by introducing fragments of colored stucco; granites and porphyries in the same way, and also by cutting into the stucco and filling the cavities with a paste having the color of the crystals it is desired to imitate. Sometimes the stucco is put upon the wall with a brush, as many as twenty coats being applied. It is then roughly polished, and the cavities and defective places filled up; and this is done over and over, until the surface has attained the desired perfection; a finer polish is then given.

So was [thrown open] the double door of the entrance-hall, letting in the warm light on the *scagliola* pillars, the marble statues, and the broad stone staircase, with its matting worn into large holes. *George Eliot, Felix Holt, I.*

Also called *canalis membranaceus* and *cochlear duct* or *canal of the cochlea*; the latter two terms, however, are sometimes restricted to mean respectively the passage between the tectorial membrane and the basilar membrane and the one between the tectorial membrane and the membrane of Reissner.—**Scala tympani**, that part of the spiral canal of the cochlea which is on the under side of the spiral lamina, and is separated from the scala media by the basilar membrane. Each cell of each filament sends out a short protuberance on the side facing the other filament. When these protuberances meet, the cell-wall becomes absorbed at the extremity of each, and an open tube is thus formed. It is the ordinary mode of conjugation in the *Mesocarpææ*.—**Scalariform vessels**, vessels in which the walls are thickened in a scalariform manner. They are especially abundant in ferns.

Also applied in the *Coniferae* to the leaves or bracts of the cone, and to the chaff on the stems of ferns. See also cuts under *imbricate* and *rosette*.—3. In zool.,

an epidermal or exoskeletal structure that is thin, flat, hard or dry, and of some definite extent; a piece of cuticle that is squamous, scaly, or horny, and does not constitute a hair, a feather, or a horn, hoof, nail, or claw; a squama; a scute; a scutellum. All these structures, however, belong to one class, and there is no absolute distinction. Scales are often of large size and great comparative thickness or solidity, and may be reinforced by bone, in which case they are commonly called *shields* or *plates*. Specifically—(a) In *ichth.*, one of the particular modifications of epidermis which collectively form the usual covering, more or less complete, of fishes; a fish-scale. They are of many forms and sizes, but have been sometimes considered under the four heads of *cycloid*, *ctenoid*, *ganoid*, and *placoid*, and fishes have been classified accordingly, as by Agassiz. (See *cycloid*, etc.) They are developed on the inner side of the general epidermis, but vary greatly in form and other characteristics. In most living fishes they are expanded horny lamellae, and imbricated, the posterior edges of one transverse row overlapping adjacent parts of the succeeding row. Growth takes place from a central, subcentral, or posterior nucleus by increase at the periphery. Generally the anterior part, or base of insertion, is provided with striae or grooves diverging backward. (1) In numerous fishes growth takes place in layers and at the posterior edges as much as at the anterior, and there are no teeth or denticles at the posterior margin: such are called *cycloid* scales. (2) When the posterior margin is beset with denticles, a *ctenoid* scale is the result. When vestiges of such teeth or denticles are retained on the surface between the nucleus and the posterior margin, the surface is to that extent *muri-cated*. In other forms the growth is almost entirely sideways and forward, and the nucleus is consequently near the posterior edge. (3) Still other fishes have a hard enameled surface to the scale, which is generally of a rhomboidal form, and such a scale is called *ganoid*; but few modern fishes are thus armed, though scales of this kind were developed by numerous extinct forms. (4) When the scales are very small, or represented by ossified papillae of the cutis, they are called *placoid*; such are found in most of the sharks. Between these various types there are gradations, and there are also numerous modifications in other directions. The presence or absence of scales becomes also of slight systematic importance in some groups, and the same family may contain species with a scaleless body and others with scales of the ctenoid and cycloid types. The scales of various fishes, as the sheepshead, mullet, and drum,

(d) In *entom.*: (1) One of the minute structures which constitute the covering of the wings of lepidopterous insects, as the furres of a butterfly or moth. These are modified hairs which when well developed are thin, flat plates, pointed at the end where they are attached to the surface and generally divided into a number of long teeth at the other end; they are set in rows overlapping each other slightly, like tiles or shingles on a roof. These scales are ornamented with microscopic lines, and are of various and often very bright colors. By covering the transparent membrane of the wings they form the beautiful patterns much admired in these insects. See cut in next column, and cut under *Leptodoptera*. (2) One of the plates, somewhat similar to those on a butterfly's wing, covering the bodies of most *Thysanura* (*Leptanotidae*, *Poduridae*). 2. A series of marks laid down at determinate distances along a line, for purposes of measurement and computation; also, the rule upon which one or more such series are laid down.—3. In music: (a) A definite and standard series of tones within some large limiting interval, like an octave, selected for artistic purposes. The first step toward an artistic system of tones is the adoption of some interval for the division of the infinite possible range of tones into convenient sections of equal length. In Greek music, this unit of division was originally the tetrachord; in medieval music, the hexachord; and in modern music, the octave, though the octave is more or less recognized in all systems. Within the tetrachord, hexachord, or octave various scales are possible. (See *tetrachord* and *hexachord*.) The abstract method whereby the octave is divided and the succession of tones ordered within it is properly called a *mode*; but when a mode is applied at some given pitch the concrete result is called a *key* or *scale* (though *mode* and *scale* are often used interchangeably in the abstract sense). A scale is distinguished from a key in that it is used simply of the tones of the key when arranged in order of pitch. The successive tones of a scale are called *degrees*; they are usually numbered from below upward. The first tone or starting-tone is called the *key-note* or *key-tone*. The historic process of scale invention is, of course, unconscious. The selection of tones seems to be controlled primarily by an instinctive perception of their harmonic relations to the starting-tone and to each other, though limited and modified by a desire to secure an even melodic succession without too short intervals. When the smallest interval allowed is the whole step or major second, five-toned or pentatonic scales are produced, such as are used among the Chinese, in the older music of various Celtic nations, and by certain semi-civilized peoples. When the half-step or semitone is tolerated, seven-toned or heptatonic scales are produced, as in the later Greek and all modern systems. When smaller intervals than the semitone are admitted, scales of more than seven tones are produced, as among the Hindus, the Persians, and other Orientals. In modern European music two chief forms of scale are used, the *major* and the *minor*, the latter having three varieties. (See *mode*), 7 (a) (3.) Both forms are termed *diatonic*. When, for purposes of modulation or of melodic variety, other intermediate tones are added, they are called *chromatic tones*, and a scale in which all the longer steps of a diatonic scale are divided by such intermediate tones is a *chromatic scale*, containing eleven tones in all. (See *chromatic*.) Properly an upward chromatic scale for melodic purposes differs from a downward, but on the keyboard they are assumed to be equivalent. In written music, a scale noted in both sharps and flats, so as to include the nominal constituents of both an upward and a downward chromatic scale, is called an *enharmonic scale*. A chromatic scale for harmonic purposes includes, in addition to the tones of the usual diatonic major scale, a minor second, a minor third, an augmented fourth, a minor sixth, and a minor seventh. When a scale of either kind is made up of tones having exact harmonic relations with the key-note, it is called *exact* or *pure*; but the compromise construction of the keyboard reduces all scales to an arbitrary form, called *tempered*. In solmization, the tones of a scale are represented by the syllables *do, re, mi, etc.* (See *interval*, *keyboard*, *solmization*, and *temperament*.) (b) Any particular scale based upon a given key-note: as, the *scale* of G or of F. Unless otherwise qualified, such a scale is understood to be a major scale. All major scales are essentially similar, except in pitch; all minor scales also. On the keyboard, however, there is considerable mechanical difference on account of the varying succession of the white and black digitals. (See *key*¹, 7.) (c) Of a voice or an instrument, same as *compass*, 5. (d) In an organ-pipe, the ratio between its width and its length: a broad scale producing full, sonorous tones, as in the open diapason; and a narrow scale, thin, string-like tones, as in the dulciana. The same usage occurs occasionally in connection with other instruments, referring to size in relation to the quality of the tones produced.

4. Succession of ascending or descending steps or degrees; progressive series; scheme of comparative rank or order; gradation.

There is in this universe a stair, or manifest *scale*, of creatures, rising not disorderly, or in confusion, but with a comely method and proportion.

5. A system of proportion by which definite magnitudes represent definite magnitudes, in a sculpture, picture, map, and the like; also, a system of proportion for taxation or other purpose.

Irving, Knickerbocker, p. 149.

6. A system of numeration or numerical notation.—7. Knight*.—*Wind-scale*, a number of descriptive terms systematically arranged for use in estimating the force of the wind. Scales of four, six, seven, ten, and twelve terms have been used by different meteorological services. Scales of all nations have very generally adopted the Beaufort scale, introduced into the British navy by Admiral Beaufort in 1805. This is a scale of twelve terms, as follows: 1, light air; 2, light breeze; 3, gentle breeze; 4, moderate breeze; 5, fresh breeze; 6, strong breeze; 7, moderate gale; 8, fresh gale; 9, strong gale; 10, whole gale; 11, storm; 12, hurricane.

scapula (skap'ū-lā), *n.*; pl. *scapulæ* (-lē). [NL., *<* *L. scapula*, the shoulder, in *L.* only in pl., *scapulæ*, the shoulder-blades, the shoulders, shoulder-pieces; prob. akin to *L. scapus*, a shaft, stem, stalk: see *scape*².] 1. In anat., the shoulder-blade, or blade-bone, or omoplate. It is the proximal element of the pectoral or scapular arch of vertebrates, especially of higher vertebrates, in which it is primitively the proximal part of a cartilaginous rod, the distal part of which is segmented off to form the coracoid. It assumes the most various shapes in different animals, but is usually flattened and expansive in mammals, in birds slender and saber-like. The scapula, whatever its shape, normally maintains connection with the coracoid, which is then a separate bone, but in all mammals above the monotremes the coracoid is completely consolidated with the scapula, appearing as a mere process of the latter. The human, like other mammalian scapula, with the exception noted, is therefore a compound bone, consisting of scapula and coracoid united. The scapula, or scapula and coracoid together, normally furnish an articulation for the clavicle when the latter is fully developed. In mammals above monotremes this articulation is with the spine or acromion. The glenoid cavity for the articulation of the humerus is always at the junction of the scapula proper with the coracoid, and when the latter is separate both bones enter into its formation. Morphologically a well-developed scapula, as in a mammal, has two ends, three borders, and three surfaces, corresponding to the prismatic rod of primitive cartilage; these parts, however, do not correspond with the borders, angles, and surfaces described in human anatomy (for which see *shoulder-blade*), the vertebral border, for instance, being really one end of the bone, and the edge of the spine being one of the morphological borders. The three surfaces correspond to the supraspinous, infraspinous, and subscapular fossae, better known as the prescapular, postscapular, and subscapular surfaces. In all mammals and birds, and most reptiles proper, the scapula closely conforms to the characters here given. In batrachians and fishes, however, whose scapular arch is complicated with additional bones, the modifications are various, and some of the coracoid elements have been wrongly regarded and named as scapular. See cuts under *omosternum*, *scapulocoracoid*, and *shoulder-blade*. See also *postscapular*, *prescapular*, *subscapular*, *suprascapular*.

In all higher vertebrates (mammals, birds, and reptiles) the scapular arch consists primitively of a cartilaginous rod, more or less perfectly segmented into a proximal moiety (scapula) and a distal moiety (coracoid), to which an accessory bone (clavicle) is frequently added, together with various other supplementary osseous or cartilaginous pieces, either in the median line in front or in the line of the clavicle. In a batrachian, as the frog, there is a distinct superior ossification forming a suprascapula, with a precoracoid and an epi-coracoid, besides the coracoid proper. In fishes the scapular arch is still further modified, especially by the presence of additional coracoid elements which have been variously homologized. Scarabæidæ (skar-a-bē'i-dē), *n. pl.* [*NL.*
(*Leach, 1817*), *cf.* *Scarabæus* + *-idæ*.] A very
large family of beetles of the lamellicorn se-
ries, having the lamellæ of the antennal club
capable of close apposition and not flattened,
and having fossorial legs. The family contains
about 7,000 described species, of which between 500 and
600 inhabit America north of Mexico. They are usually
of large size, and among them are the largest beetles
known. Many of them are leaf-feeders, others live on
fruit, flowers, honey, sap, decaying animal matter, and
excrement. The larvae are robust white grubs, living or-
dinarily underground, or in decaying stumps and logs,
or in dung. The males are usually much larger than the
females, and are often distinguished by horns upon the
head or prothorax, or by better-developed antennæ, or by
modifications of the legs. Many noted pests to agricul-
ture belong to this group, such as the May-beetles or
June-bugs and cockchafer of America and Europe, the
Anisoplia austriaca of the Russian wheat-fields, and the
rose-chaffer and fig-eater of the United States. Corre-

The sacred scarab of
the Egyptians is *S.*
sacer, found through-
out the countries bor-
dering on the Mediter-
ranean. It is probable
also that another spe-
cies, *S. laticollis*, was
held in religious veneration by the Egyptians, as the
scarab is sometimes figured by them with striate elytra,
a character which pertains to this alone. Species of *Ateu-*
chus, as *A. pius*, were formerly included in this genus.

The physical use in MD. *schaers afscheren*, shear off close, shave close, It. *cogliere scarso*, strike close, graze (see *scarce*, *adv.*), *scarsare*, cut off, pinch, scant (see *scarce*, *v.*), suggests some confusion with MD. *schaers*, a pair of shears, also a plowshare, and the orig. verb *scheeren*, shear (see *shear*, *shears*, *share*). scheme (skē'mā), *n.*; pl. *schemata* (-mā-tā). [*< L. schema*, *< Gr. σχήμα*, shape, figure, form: see *scheme*.] 1. A diagram, or graphical representation, of certain relations of a system of things, without any pretense to the correct representation of them in other respects; in the Kantian philos., a product of the imagination intermediate between an image and a concept, being intuitive, and so capable of being observed, like the former, and general or quasi-general, like the latter.

The *scheme* by itself is no doubt a product of the imagination only, but as the synthesis of the imagination does not aim at a single intuition, but at some kind of unity alone in the determination of the sensibility, the *scheme* ought to be distinguished from the image. Thus, if I place

five points, one after the other, . . . this is an image of the number five. If, on the contrary, I think of a number in general, whether it be five or a hundred, this thinking is rather the representation of a method of representing in one image a certain quantity (for instance, a thousand) according to a certain concept, than the image itself, which, in the case of a thousand, I could hardly take in and compare with the concept. This representation of a general procedure of the imagination by which a concept receives the image I call the *scheme* of such a concept.

Kant, Critique of Pure Reason, tr. by Max Müller, p. 140.

If our system of notation be complete, we must possess not only one notation capable of representing . . . syllogisms of every figure and of no figure, but another which shall at once and in the same diagram exhibit every syllogistic mode, apart from all *schematic* differences, be they positive, be they negative.

Every particle of matter, whatever form or *schematism* it puts on, must in all conditions be equally extended, and therefore take up the same room.

Creech.

3. A system of schemata; a method of employing schemata.

We have seen that the only way in which objects can be given to us consists in a modification of our sensibility, and that pure concepts a priori must contain, besides the function of the understanding in the category itself, formal conditions a priori of sensibility (particularly of the internal sense) which form the general condition under which alone the category may be applied to any object. We call this formal and pure condition of the sensibility, to which the concept of the understanding is restricted in its application, its *scheme*; and the function of the understanding in these schemata, the *schematism* of the pure understanding.

Kant, Critique of Pure Reason, tr. by Max Müller, p. 140.

Judd to designate a change in crystals, consisting in the development along certain planes of tabular, bacillar, or stellar inclosures, which, reflecting the light falling upon them, give rise to a submetallic sheen as the crystal is turned in various directions. This peculiarity has long been known to the Germans, and several minerals which exhibit it were classed together under the name of *schiller-spar* (which see). It is varieties of the monoclinic and rhombic pyroxenes, and especially bronzite and diallage, that exhibit this schillerization.

Attraction is the most general law in the material world, and prevents a *schism* in the universe.

Theodore Parker, Ten Sermons on Religion.

2. The offense of seeking to produce a division in a church. In the authorized version of the New Testament the word *schism* occurs but once (1 Cor. xii. 25); but in the Greek Testament the Greek word *σχίσμα* occurs eight times, being rendered in the English version 'rent' (Mat. ix. 16) and 'division' (John vii. 43; 1 Cor. xi. 18). See def. 1.

schist (shist), *n.* [< F. *schiste*, < L. *schistos*, split, cleft, divided, < Gr. *σχίστός*, easily cleft, < *σχίζω*, cleave: see *schism*.] A rock the constituent minerals of which have assumed a position in more or less closely parallel layers or folia, due not to deposition as a sediment, but—in large part, at least—to metamorphic action, which has caused a rearrangement or imperfect crystallization of the component minerals, or the formation of new ones, these, in the course of the process, having assumed

the parallel arrangement characteristic of the rock. *Schist* and *slate* are not essentially different terms; but of late years the latter has been chiefly employed to designate a fine-grained argillaceous rock divided into thin layers by cleavage-planes, and familiar in its use for roofing: while the word *schist* is generally employed in composition with a word indicating the peculiar mineral species of which the rock is chiefly made up, and which by its more or less complete foliation gives rise to the schistose structure: thus, *hornblende-schist*, *chlorite-schist*, *mica-schist*, etc.—all included under the general designation of *crystalline schists*, among which argillaceous schist also belongs, and from which it is separated only because its fissility is, as a general rule, more perfect than that of the other schists, and because it is for this reason of much practical importance, especially in its application to roofing. Also spelled *shist*.—**Knotted schist**. Same as *knott*, 3 (*f*).—**Protozoic schists**. See *protozoic*.

schistose, schistous (shis'tōs, -tus), *a.* [< *schist* + *-ose, -ous*.] Having the structure of schist; resembling schist, or made up of a rock so designated. A schistose structure differs from that resulting from sedimentation in that the former bears the marks of chemical action in the more or less complete interlacing or felting of the component particles, and in the continual breaks or want of continuity of the laminae, while in the latter the particles are only held together by some cement differing from them in composition, or even by pressure alone, and are arranged in a more distinctly parallel order than is usually the case with the schists. In rocks in which a slaty cleavage is very highly developed, as in roofing-slate, this cleavage is almost always quite distinct from and independent in position of the lines of stratification, and this fact can ordinarily be recognized with ease in the field. There are cases, however, in which a schistose structure has been developed in a mass of rock parallel with the planes of stratification. Also spelled *shistose, shistous*.

schizognathous (ski-zog'nā-thus), *a.* [< NL. *schizognathus*, < Gr. σχίζειν, cleave, split, + γνάθος, jaw.] In *ornith.*, having the bony palate cleft in such a way that in the dry skull "the blade of a thin knife can be passed without meeting with any bony obstacle from the poste-

rior nares alongside the vomer to the end of the beak" (Huxley); exhibiting schizognathism in the structure of the bony palate: as, a *schizognathous* bird; a *schizognathous* palate; a *schizognathous* type of palatal structure. The vomer, whether large or small, tapers to a point in front, while behind it embraces the basisphenoidal rostrum, between the palatines; these bones and the pterygoids are directly articulated with one another and with the basisphenoidal rostrum, not being borne upon the divergent posterior ends of the vomer; the maxillopalatines, usually elongated and lamellar, pass inward over the anterior ends of the palatines, with which they unite, and then bend backward, along the inner ends of the palatines, leaving a broader or narrower fissure between themselves and the vomer, on each side, and do not unite with one another or with the vomer.

Schizomycetes (skiz-ō-mi-sē'tēz), *n. pl.* [NL., < Gr. σχίζειν, cleave, split, + μύκης, pl. μύκητες, a fungus, mushroom: see *Mycetes*.] A class or group of minute vegetable organisms known as bacteria, microbes, microphytes, etc., and allied forms, belonging to the achlorophyllous division of the *Schizosporeæ* of Cohn (the *Schizophyta* of later authorities), or to the *Protophyta* of still more recent authors. They were at first regarded as being simple fungi, and hence are sometimes still called *fission fungi*, but recent investigations indicate that they are more closely allied to the *Schizophyceæ* or lower algae than to the true fungi. They are probably degenerate algae, a condition which has been brought about by their saprophytic or parasitic habits. They consist of single cells which may be spherical, oblong, or cylindrical in shape, or of filamentous or various other aggregations of such cells. The cells are commonly about 0.001 millimeter in diameter, or from two to five times that measurement; but smaller and a few larger ones are known. They are, with one or two exceptions, destitute of chlorophyll, and multiply by repeated bipartitions. True spores are known in several forms, but no traces of sexual organs exist. They are saprophytic or parasitic, and occur the world over as saprophytes. They abound in running streams and rivers, in still ponds and ditches; in the sea, in bogs, drains, and refuse-heaps; in the soil, and wherever organic infusions are allowed to stand; in liquids containing organic matter, as blood, milk, wine, etc.; and on solid food-stuff, such as meat, vegetables, preserves, etc. As parasites, numerous species inhabit various organs of men and animals, causing most of the infectious diseases, as tuberculosis, typhoid fever, cholera, etc. Plants are subject to their attack to a more limited degree, a circumstance that is probably due to the acid fluids of the higher vegetable organisms. Schizomycetes vary to a considerable extent according to the conditions of their environment, and hence many growth-forms occur which have frequently received different generic names. The round growth-forms are called *Coccus* or *Micrococcus*; the rod-like forms have been termed *Bacillus*, *Bacterium*, etc.; the shortly coiled forms are known as *Vibrio*; the spiral forms have received the names *Spirillum* or *Spirochaeta*; and the very elongated filiform ones are *Leptothrix*, etc. Their behavior with reference to the supply or exclusion of oxygen has led to their division by Pasteur into *aerobiotic*, or such as require a plentiful supply of free oxygen for the purpose of vegetation, and *anaerobiotic*, or those in which vegetation is promoted by the exclusion of oxygen, or at least is possible when oxygen is excluded. There are, however, various intermediate forms. See *entophyte*, *Fungi*, *Protophyta*, *Bacteriaceæ*, *Bacterium*, *Micrococcus*, *Leptothrix*, *Bacillus*, *Spirillum*, *Spirochaeta*, *Vibrio*.

Schizopteris (ski-zop'te-ris), *n.* [NL., < Gr. *σχίζω*, cleave, split, + *πτερίς*, a wing, a kind of fern: see *Pteris*.] A generic name given by Brongniart to a fossil plant found in the coal-measures of the coal-field of the Saar and in Saxony, and supposed to belong to the ferns. The genus is now included in *Rhacophyllum*, but of this genus (as well as of the plants formerly called *Schizopteris*) little is definitely known.

Schizorhinæ (skiz'ō-rī'nē), *n. pl.* [NL.: see *schizorhinal*.] Schizorhinal birds collectively.

Schizorhinal (skiz'ō-rī'nal), *a.* [< Gr. *σχίζω*, cleave, split, + *ῥίς* (rh-), the nose, + *-al*.] In *ornith.*, having each nasal bone deeply cleft or forked: opposed to *holorhinal*. The term denotes the condition of the nasal bone on each side (right and left), and not the separateness of the two nasal bones, which it has been misunderstood to mean. By a further mistake, it has been made to mean a slit-like character of the external nostrils, with which it has nothing to do.

In the Columbidae, and in a great many wading and swimming birds, whose palates are cleft (schizognathous), the nasal bones are *schizorhinal*: that is, cleft to or beyond the ends of the premaxillaries, such fission leaving the external descending process very distinct from the other, almost like a separate bone. Pigeons, gulls, plovers, cranes, auks, and other birds are thus split-nosed.

It is characterized by spikelets in scattered clusters forming a spike or panicle with numerous empty lower glumes, and bisexual flowers with two or three lodicules, six stamens, three elongated styles, and a pedicel continued beyond the flowers. There are about 8 species, natives of the Malay archipelago, China, and the Pacific islands. They are tall and arborescent grasses, resembling the bamboo in habit and leaf. Several species reach 25 to 40 feet or more in height, and several are cultivated for ornament or for culinary use, the young shoots being eaten in Java and elsewhere under the name of *rebong*.

The blade is about 3 feet long and without point, the end being cut square off: each edge is very sharp for a few inches from the end of the blade. It is used with a sweeping blow around the adversary's guard, so as to cut the head or face with the sharpened corner. The schläger has a heavy basket-hilt completely protecting the hand. A heavy gauntlet of leather covers the arm to the elbow. The usual guard is by holding the blade nearly vertical, pommel uppermost, the hand just above the level of the eyes.

The species is *S. wilsoni*, better known as *Paradisæa* or *Diphyllodes wilsoni*, of Waigiu and Batanta. The male is 7½ inches long, the tail 2, with its middle pair of feathers as long again, twice crossed and then curled in arietiform figure. The bald head

is bright blue, the fore back is rich yellow, the rest lustrous crimson; the breastplate is mostly glittering green, and other parts of the plumage are of varied and scarcely less burnished hues. The female is somewhat smaller, and in plumage unlike the male, as usual in this family. The species has several technical synonyms. Professor Schlegel called it *Paradisæa calca*, but not till after Mr. Cassin of Philadelphia had dedicated it to Dr. T. B. Wilson of that city. Mr. Elliot, the monographer of the *Paradisæidae*, has it *Diphyllodes respublica*, after a mistaken identification made by Dr. Schaler of a bird very inadequately characterized by Prince Bonaparte, which belongs to another genus.

Schleichera (shli-kēr-ā), *n.* [NL. (Willdenow, 1805), named after J. C. Schleicher, a Swiss botanist, author (1800) of a Swiss flora.] A genus of plants of the order *Sapindaceæ*, type of the tribe *Schleicheræ*. It is characterized by apetalous flowers with a small calyx of four to six uniform and valvate lobes, a complete and repand disk, six to eight long stamens, and an ovary with three or four cells and solitary ovules, becoming a dry and indehiscent one- to three-celled ovoid and undivided fruit, containing a pulpy and edible aril about the black top-shaped seed. The only species, *S. trijuga*, is a native of India, Ceylon, and Burma, especially abundant in Pegu, sometimes called *lactee*, and known in India as *kosumbia*. It is a large hardwood tree with alternate and abruptly pinnate leaves, usually of three pairs of leaflets, and with small long-pedicelled flowers in slender racemes. Its timber is very strong, solid, and durable. In India and Ceylon it is valued as one of the trees frequented by the lac-insect (see *lac*), and its young branches form an important source of shellac. The oil pressed from its seeds is there used for burning in lamps and as a remedy for the itch.

Schleicherææ (shli-kēr-ē-ē), *n. pl.* [NL. (Radlkofer, 1888), < *Schleichera* + *-ææ*.] A tribe of dicotyledonous plants of the order *Sapindaceæ* and suborder *Sapindææ*, typified by the monotypic genus *Schleichera*, and containing also 3 other species in 2 genera, natives of tropical Africa and Madeira.

They are bulbous plants with long linear radical leaves, and small flowers in a dense spike on a tall leafless scape, remarkable for the long-persistent perianth and stamens. *S. officinale*, often called *Asagrea officinalis*, is the cevadilla-plant of Mexico. (See *cevadilla*.) Its seeds are the cevadilla or sabadilla of medicine.

Schœnus (skē'nus), *n.* [*NL.* (Linnaeus, 1753), < *Gr. σχοινός*, a rush.] A genus of monocotyledonous plants, of the order *Cyperaceae*, the sedge family, and of the tribe *Rhynchosporae*, characterized by few-flowered spikelets in dark or blackish clusters which are often panicked or aggregated into a head or spike. Each spikelet contains a flexuous extension of the pedicel, numerous two-ranked glumes, and flowers all or only the lowest fertile, and furnished with six (or fewer) slender bristles, usually three stamens, and a three-cleft style crowning an ovary which becomes a small three-angled or three-ribbed beakless nut. Pertaining to or characteristic of scholasticism or the schoolmen; according to the methods of the Christian Aristotelians of the middle ages. See *scholasticism*.

The Aristotelian philosophy, even in the hands of the master, was like a barren tree that conceals its want of fruit by profusion of leaves. But the *scholastic* ontology was much worse. Hence—3. One who deals with religious questions in the spirit of the medieval scholastics.—4. A member of the third grade in the organization of the Jesuits. A novitiate of two years' duration and a month of strict confinement are prerequisite to entrance to the grade of scholastic. The term consists of five years' study in the arts, five or six years of teaching and study, a year of final novitiate, and from four to six years of study in theology. The scholastic is then prepared to be admitted as a priest of the order.

scholasticism (skō-las'ti-sizm), *n.* [= *Sp. escolasticismo* = *G. scholasticismus*, < *NL. scholasticismus*, *scholasticism*, < *L. scholasticus*, *scholastic*: see *scholastic*.] The Aristotelian teaching of the medieval schools and universities, and similar teaching in Roman Catholic institutions in modern times, characterized by acknowledgment of the authority of the church, by being largely, if not wholly, based upon the authority of the church fathers, of Aristotle, and of Arabian commentators, and by its stiff and formal method of discussion. It consisted of two distinct

and independent developments, the one previous the other subsequent to the discovery of the extralogical works of Aristotle in the last part of the twelfth century. Scholasticism should be considered as arising about A. D. 1000, and is separated by a period of silence from the few writers between the cessation of the Roman schools and the lowest ebb of thought (such as Isidorus, Rabanus, Gerbert, writers directly or indirectly under Arabian influence, Scotus Erigena and other Irish monks, the English Alcuin, with his pupil Erfridigis, etc.), writers marked by great ignorance, by a strong tendency to materialize abstractions, by a disposition to adopt opinions quite arbitrarily, but also by a certain freedom of thought. The first era of scholasticism was occupied by disputes concerning nominalism and realism. It naturally falls into two periods, since the disputants of the eleventh century took simple and extreme ground on one side or the other, the nominalistic rationalist Berengarius being opposed by the realistic prelate Lanfranc, the Platonizing nominalist Roscellin by the mystical realist Anselm; while in the twelfth century the opinions were sophisticated by distinctions until they cease to be readily classified as nominalistic and realistic. The scholastics of the latter period included Peter Abelard (1079-1142); Gilbert of Poitiers (died 1154), one of the few writers of the twelfth century ever quoted in the thirteenth; Peter Lombard (died 1164), compiler of the four books of "Sentences," or opinions of the fathers, which was the peg on which much later speculation was hung as commentary; and John of Salisbury (died 1180), an elegant and readable author. For more than a generation after his death the schoolmen were occupied with studying the works of Aristotle and the Arabians, without producing anything of their own. Then began the second era of scholasticism, and this divides itself into three periods. During the first, which extended to the last quarter of the thirteenth century, Alexander of Hales (died 1245), Albertus Magnus (1193-1280), and St. Thomas Aquinas (died 1274) set up the general framework of the scholastic philosophy, while Petrus Hispanus (perhaps identical with Pope John XXI., who died 1277) wrote the standard text-book of logic for the remainder of the middle ages, and Vincent of Beauvais (died about 1264) made an encyclopedia which is still found in every library of pretension. During this period the University of Paris received a thorough organization, and thought there became exclusively concentrated upon theology. The second period, which lasted for about a century, was the great age of scholastic thought, and it may be doubted whether the universities of western Europe have at any subsequent time been so worthy of respect as when Duns Scotus (died 1308) and his followers were working up the realistic conception of existence, while "Durus" Durandus (died 1332), Occam (died about 1349), and Buridanus (died after 1350) were urging their several nominalistic theories, and other writers, now so forgotten that it is useless to name them, were presenting other subtle propositions commanding serious examination. During this period the scholastic forms of discussion were fully elaborated—methods cumbersome and inelegant, but enforcing exactitude, and conformed to that stage of intellectual development. The third period, extending to the time of the extinction of scholasticism, early in the sixteenth century, presented somewhat different characters in different countries. It was, however, everywhere marked by the formal perfectionism of systems, and attention to trivial matters, with decided loss of vitality of thought. Among the innumerable writers of this time may be mentioned Albert of Saxony (fourteenth century), Pierre d'Ailly (1350-1425), Gerson (1363-1429), and Eckius, adversary of Luther. Those subsequent writers who follow colorless traditions of scholasticism, and maintain front against modern thought, must be considered as belonging to an era different from either of those mentioned.

scholia, *n.* Latin plural of *scholium*.

scholiast (skō'li-ast), *n.* [= F. *scoliaste* = Sp. *escolista* = Pg. *escolaste* = It. *scoliaste* = G. *scholiast*, < NL. *scholiasta*, < MGr. *σχολιαστής*, a commentator, < *σχολιάζω*, write commentaries, < Gr. *σχολίον*, a commentary: see *scholium*.] One who makes scholia; a commentator; an annotator; especially, an ancient grammarian who annotated the classics.

The title of this satire, in some ancient manuscripts, was "The Reproach of Idleness"; though in others of the *scholiasts* it is inscribed "Against the Luxury and Vices of the Rich." Dryden, tr. of Persius's Satires, iii., Arg.

mark; an explanatory comment; specifically, an explanatory remark annexed to a Latin or Greek author by an early grammarian. Explanatory notes inserted by editors in the text of Euclid's "Elements" were called *scholia*, and the style of exposition resulting from this was considered by later writers so admirable that they deliberately left occasion for and inserted *scholia* in their own writings. A geometrical scholium is, therefore, now an explanation or reflection inserted into a work on geometry in such a way as to interrupt the current of mathematical thought.

Schomburgkia (shom-bër'ki-ä), *n.* [NL. (Lindley, 1838), named after the traveler R. H. Schomburgk (1804-65).] A genus of orchids, of the tribe *Epidendreae* and subtribe *Laelieae*. It is characterized by a terminal and loosely racemed inflorescence with a somewhat wavy perianth, each anther with eight pollen-masses, four in each cell. There are about 13 species, all natives of tropical America. They are epiphytes with handsome flowers in a simple raceme on an elongated terminal peduncle, and thick pseudobulbs or long fleshy stems, which are covered with many sheaths and bear at the apex one, two, or three ovate or elongated rigid and fleshy leaves. They are remarkable for the very long and slender flower-stems, and the large dry sheaths enveloping them. Browne, 1756), so called with ref. to the use of the leaves as a sunshade; **<** Gr. *σκιάς* (*skiad-*), a shade, canopy (**<** *σκιά*, shade), + *φύλλον*, leaf.] A genus of polypetalous plants, of the order *Araliaceæ* and series *Panaceæ*. It is characterized by flowers with usually five valvate petals united at the apex into a deciduous membrane, as many rather long stamens, a flattened disk, and an ovary with three to five cells with distinct styles. The fruit consists of fleshy drupes with a hard compressed stone. There are about 25 species, all natives of tropical America. They are trees or shrubs, usually with radiately compound leaves and entire leaflets, and often with elongated stipules. The only species, *S.* (sometimes *Taxus verticillata*), is a native of Japan, known in cultivation as *umbrella-pine* and *parasol-fir*. It is a tall evergreen tree, bearing as its true leaves minute scales, and as apparent leaves, rigid linear phylloids, resembling pine-needles, which are produced yearly in small radiating and long-persistent tufts. The hard, thick cones, about 3 inches long, consist of numerous closely imbricated rounded woody scales which finally gape apart as in the pine, discharging the flattened and broadly winged seeds. It is a tree of slow growth, with compact white wood, and reaches a height of 80 or sometimes 140 feet.

It is restricted by recent authors to such *Sciænina* as have the lower pharyngeal bones distinct, the lower jaw without barbels, the anal spines two, and well-developed teeth persistent in both jaws. In this narrow sense the species are still so numerous in all warm seas that attempts have been made to establish various sections regarded by some as of generic

value. The fish to which the classic name *sciæna* was given is the maigre, *S. aquila*. *S. (Sciænops) ocellata* is the redfish, red-horse, red-bass, or channel-bass, which occurs along the Atlantic coast of the United States, attains a weight of from 30 to 40 pounds, and is known by an ocellus on each side of the tail (see cut under *redfish*). *S. (Rhinnoscion) saturna* is the red roncador of the same country. See also cut under *roncador*.

Sciænidae (si-en-i-dē), *n. pl.* [**NL.**, **<** *Sciæna* + *-idæ*.] A family of acanthopterygian fishes, typified by the genus *Sciæna*, to which different limits have been ascribed. (a) By Bonaparte, in 1833, the name was applied to the *Sciænoides*, which form Cuvier's third family of acanthopterygian fishes. These have the preoperculum serrated and spines to the operculum, the bones of the cranium and face generally cavernous, and no teeth on the vomer and palatines. It included not only the true *Sciænidae*, but many other fishes erroneously supposed to be related. (b) By Müller it was restricted to those species of *Sciænoides* which have separate lower pharyngeals. (c) By Lowe it was limited to fishes with an oblong or moderately elongated body, covered with ctenoid scales, with the lateral line continuous and running out on the caudal fin, the head with the bones more or less cavernous and with the snout projecting, dorsal fins two (the first short and with spines and the second elongate or oblong), the anal short or moderate with not more than two spines, the pectorals with branched rays,

and the ventrals thoracic and complete. In this sense it has been used by almost all recent writers. (d) In Günther's system it is the only family of the *Acanthopterygii sciæniformes*. It is a large and important family of 150 species of about 30 genera; many reach a large size, and nearly all are valued food-fishes. They are carnivorous, and most of them make a noise variously called *croaking*, *grunting*, *snorting*, and *drumming*. The air-bladder is generally complicated, and supposed to be concerned in the production of the noise. Hence various names of these fishes, as *croakers*, *grunders* or *grunts*, *drums*, *roncadors*, etc. With few exceptions, the members of the family are salt-water fishes, and they are widely distributed in tropical, warm, and temperate seas. Two species are British, the maigre, *Sciæna* (*Pseudosciæna*) *aquila*, and the bearded umbrina, *Umbrina cirrosa*. Many are American, as the fresh-water drum, croaker, sheephead, or thunder-pumper, *Haplochromis grunniens*; the drum, *Pogonias chromis*; redfish and roncadors of the genera *Sciæna*, *Sciænops*, and *Roncador*; the spot or ladyfinger, *Leiostomus xanthurus*; a kind of croaker, *Micropogon undulatus*; roncadors of the genus *Umbrina*; kingfish of the genus *Menticirrhus*; queenfish of the genus *Seriola*; weakfish, sea-trout, or squeteagus of the genus *Cynoscion* (formerly *Otolithus*). The family is divisible into the subfamilies *Sciænina*, *Otolithina*, *Leiostomina*, and *Haplodromina*. Also *Sciænoides*. See cuts under *croaker*, *drum*, *redfish*, *roncador*, *Sciæna*, and *weakfish*.

2. Knowledge gained by systematic observation, experiment, and reasoning; knowledge coördinated, arranged, and systematized; also, the prosecution of truth as thus known, both in the abstract and as a historical development.

Since all phenomena which have been sufficiently examined are found to take place with regularity, each having certain fixed conditions, positive and negative, on the occurrence of which it invariably happens, mankind have been able to ascertain . . . the conditions of the occurrence of many phenomena; and the progress of science mainly consists in ascertaining these conditions.

J. S. Mill.

Science is nothing but the finding of analogy, identity in the most remote parts.
Emerson, *Misc.*, p. 75.

In science you must not talk before you know. In art you must not talk before you do. In literature you must not talk before you think. . . . Science.—The knowledge of things, whether Ideal or Substantial. Art.—The modification of Substantial things by our Substantial Power. Literature.—The modification of Ideal things by our Ideal Power.
Ruskin, *The Eagle's Nest* (1872), § 3.

The work of the true man of Science is a perpetual striving after a better and closer knowledge of the planet on which his lot is cast, and of the universe in the vastness of which that planet is lost.

J. N. Lockyer, *Spec. Anal.*, p. 1.

3. Knowledge regarding any special group of objects, coördinated, arranged, and systematized; what is known concerning a subject, systematically arranged; a branch of knowledge: as, the science of botany, of astronomy, of etymology, of metaphysics; mental science; physical science; in a narrow sense, one of the physical sciences, as distinguished from mathematics, metaphysics, etc. In reference to their degree of specialization, the sciences may be arranged as follows. (A) *Mathematical*, the study of the relations of the parts of hypothetical constructions, involving no observation of facts, but only of the creations of our own minds, having two branches—(1) *pure mathematics*, where the suppositions are arbitrary, and (2) *applied mathematics*, where the hypotheses are simplifications of real facts—and branching again into (a) *mathematical philosophy*, as the theory of probabilities, etc., and (b) *mathematical physics*, as analytical mechanics, etc., and (c) *mathematical psychology*, as political economy, etc. (B) *Philosophy*, the examination and logical analysis of the general body of fact—a science which both in reason and in history precedes successful dealing with special elements of the universe—branching into (1) *logic* and (2) *metaphysics*. (C) *Nomology*, the science of the most general laws or uniformities, having two main branches—(1) *psychology* and (2) *general physics*. (D) *Chemistry*, the determination of physical constants, and the study of the different kinds of matter in which these constants differ. (E) *Biology*, the study of a peculiar class of substances, the protoplasm, and of the kinds of organisms into which they grow. plants, type of the tribe *Scilleæ*. It is characterized by flowers with separate spreading perianth-segments, marked by a single central nerve, stamens with thread-shaped filaments, and a three-celled ovary with slender style, and usually two ovules in each cell. The fruit is a thin globose three-lobed capsule, long enveloped by the withered perianth, and containing three to six black obovoid or roundish seeds with a hard albumen. There are about 80 species, natives of the Old World throughout temperate regions, and also within the tropics upon mountains, with one species said to occur in Chili. They are stemless plants from an onion-like coated bulb, with narrow radical leaves, and flowers on a leafless scape, which are blue, pink, or purple, and form racemes which are often very much prolonged. Many are cultivated for borders, especially *S. amurensis* (*S. sibirica*), with porcelain-blue flowers in earliest spring. The *Scilleæ* include about 23 genera, of which *Scilla* is the type, mainly natives of temperate climates and very largely South African. It is characterized by a shrubby climbing stem, branches bearing numerous usually oblique leaves with numerous nearly equal curving veins, and bisexual flowers without floral envelopes, consisting of four stamens and a thick truncate and somewhat prismatic ovary which is strongly dilated upward and contains one cell and one ovule with a large embryo destitute of albumen. There are 8 species, natives of the East Indies, especially Bengal and Java. They are climbing shrubs clinging by rootlets produced on the branches, and bear taper-pointed leaves, ovate or narrower, with long broadly sheathing petioles. The flowers are borne in dense masses over a cylindrical spadix enclosed in a boat-shaped spathe, and form in fruit a syncarp of closely united juicy berries. Many remarkable plants of other genera have been cultivated under this name, especially those with perforated leaves now classed under *Monstera*. Some species have been called *Indian ivy*, as *S. hederaea*, a vine with abruptly pointed leaves. Several bear ornamental white-mottled leaves, as *S. scintillometer (sin-ti-lom'e-tēr), *n.* [< *L. scintilla*, a spark, + Gr. *μέτρον*, measure.] An instrument devised by Montigny for measuring the intensity of scintillation of the stars. The apparatus consists essentially of a circular glass plate mounted obliquely upon an axis very near and in front of the eyepiece of a telescope. An opening in the center of the plate allows the insertion of a ring, through which passes the axis, parallel to the optical axis of the telescope

and at a distance from it of about twenty-five millimeters. The plate is rotated about the axis by a mechanism. By this device, the rays of light from a star are refracted through the inclined glass plate, and the image describes a perfect circle in the field. If the star undergoes no change, the circumference is a continuous line exhibiting the color of the star; but if the star scintillates, this circumference is divided into fugitive arcs of different colors. The number of changes of color per unit of time indicates the intensity of the scintillation.

Scirpæ (sēr'pē-ē), *n. pl.* [*NL. (Nees von Esenbeck, 1834), < Scirpus + -æ.*] A large tribe of monocotyledonous plants, of the order *Cyperaceæ*, the sedge family. It is characterized by numerous mostly bisexual flowers in each spikelet, without empty glumes or with only one or two, and without perianth or with its representatives reduced to filliform bristles or to flattened scales. It includes about 1,500 species, of 17 genera, of which *Scirpus*, the bulrush, is the type. They are grass-like or rush-like plants, with either triangular or rounded stems, and with long flat triangular or cylindrical leaves. The inflorescence becomes chiefly conspicuous when in fruit, and is often ornamental from its shape or from its dark-brown colors, or by reason of the frequent lengthening of the bristles into woolly or plume-like tufts.

Scirpus (sēr'pus), *n.* [*NL. (Tournefort, 1700), < L. scirpus, sirpus, a rush, bulrush.*] A genus of monocotyledonous plants including the bulrushes, type of the tribe *Scirpæ* in the order *Cyperaceæ*. It is characterized by small many-flowered roundish spikelets with imbricated and numerous glumes, each flower bisexual and usually with six bristles, representing a perianth, and surrounding the ovary, from which the continuous and slender style falls away without leaving any conspicuous tubercle. Over 300 species have been described, now reduced to 200 by the best authorities. About 30 species occur in the United States. They are small tufted or floating annuals, or strong perennials with a creeping rootstock, bearing usually a compound panicle of numerous brown spikelets, sometimes reduced to a small cluster or solitary. They are known by the general names *bulrush* and *club-rush*, the first applied especially to *S. lacustris*, a species of peculiar habit, with tall, smooth, round stems of a blue-green color projecting out of lake- and river-waters; also called in England *mat-rush*, from its use in making mats, ropes, chair-bottoms, and hassocks. Its variety *occidentalis* and the kindred species *S. Tatora* are the tule of California. (See *tule*.) *S. maritimus*, the sea club-rush,

with a dense compact cluster of large spreading spikelets, each often over an inch long, is a characteristic feature of sea-shore marshes in both tropical and temperate climates throughout the world. (For *S. cæspitosa*, see *deer-hair*.) Several species of *Eriophorum* were formerly referred here, as *E. cyperinum*, the most conspicuous of American rushes in fresh-water swamps, and known as *wool-grass* and *cotton-grass*.

There are over 100 species, natives of tropical and subtropical regions, extending into temperate climates in North America, where 12 species (known as *nutgrass*) occur on the Atlantic coast, 3 as far north as Massachusetts. They are rush-like herbs of various habit, either low and spreading or tall and robust, bearing grass-like leaves, and often with rigid prickly-pointed bracts below the involucre, giving to *S. flagellum* the name *cutting-grass* in the West Indies. See *knife-grass*, *razor-grass*, and *Kobresia*.

They are physoclistous fishes, with the body scaly and a series of keeled scales along each side of the belly, the margin of the upper jaw formed by the intermaxillaries mesially and by the maxillaries laterally, the lower pharyngeals united in a single bone, and the dorsal fin opposite the anal. In a broad sense, the family consists of about 8 genera and 100 species, including the belonids or gars, the hemirhamphines or halfbeaks, and the exocoetines or flying-fish. In a restricted sense, it includes the flying-fishes and hemirhamphines as well as the sauries, the belonids being excluded. Also *Scomberesocidæ*. See cut under *sauri*.

The body is long, compressed, and covered with small deciduous scales; the jaws are more or less produced into a beak; the gill-rakers are long, slender, and numerous; the air-bladder is large; and there are no pyloric caeca. The dorsal and anal fins are opposite as in *Esox*, and finlets are developed as in *Scomber*. In *S. saurus*, the true saury, also called *striper* and *bill-fish*, the beak is long; the color is olive-brown, silvery on the sides and belly; and the length is about 18 inches. This species is wide-ranging in the open sea. *S. brevipinnis* is a smaller saury, with the jaws scarcely forming a beak; it is found on the coast of California. Also *Scomberesox*. See cut under *sauri*.

They are fishes of the high seas, graceful in form, beautiful in color, and among the best for the

table. A technical difference from *Scomber* is the length of the spinous dorsal fin, which has more than twelve spines and is contiguous to the second dorsal, the presence of a caudal keel, the strength of the jaw-teeth, and the weakness of those on the vomerine and palatine bones. This genus used to be called *Cybius*; its type is the cero, *S. regalis*, which attains a weight of 20 pounds. *S. caballa* sometimes weighs 100 pounds. All the foregoing inhabit the Atlantic, *S. concolor* the Pacific.

Scombridæ (skom'bri-dē), *n. pl.* [NL., < *Scomber*² + *-idæ*.] A family of carnivorous physoclistous acanthopterygian fishes, typified by the

genus *Scomber*, to which very different limits have been ascribed. (a) In Günther's system, a family of *Acanthopterygii cottoscombriformes*, with unarmed cheeks, two dorsal fins, either finlets or the spinous dorsal composed of free spines or modified into a suctorial disk, or the ventrals jugular and composed of four rays, and scales none or very small. (b) By Bonaparte, first used as a synonym of *Scomberoides* of Cuvier; later restricted to such forms as had two dorsal fins or several of the first rays of the dorsal spiniform. (c) By Gill, limited to *Scombroidea* of a fusiform shape, with the first dorsal fin elongate, or separated by a wide interval from the soft dorsal, with posterior rays of the second dorsal and of the anal generally detached as special finlets, and with numerous vertebrae. The body is elongate, not much compressed, and covered with minute cycloid scales, or quite naked; the scales sometimes united into a kind of corselet anteriorly; the lateral line is present; the branchiostegals are seven; the dorsal fins two, of which the first has rather weak spines, and the second resembles the anal; the caudal peduncle is very slender, usually keeled, and the lobes of the caudal fin are divergent and falcate, producing the characteristic deeply forked tail; the ventral fins are thoracic in position, of moderate size, with a spine and several soft rays; the vertebrae are numerous (more than twenty-five); pyloric caeca are many; the air-bladder is present or absent; the coloration is metallic and often brilliant. There are 17 genera and about 70 species, all of the high seas and wide-ranging, in some cases cosmopolitan; and among them are extremely valuable food-fishes, as mackerel of all kinds, bonitos, tunnies, and others. See cuts under *bonito*, *mackerel*, *Scomberomorus*, and *scombroide*.

Scombrinae (skom-brī'nē), *n. pl.* [*NL., < Scomber² + -inae.*] A subfamily of *Scombridae*, to which various limits have been assigned. (a) By Gill, limited to those *Scombridae* which have two dorsals widely distant, and thus including only the typical mackerels and frigate-mackerels. (b) By Jordan and Gilbert, extended to embrace those with finlets, and with the dorsal spines less than twenty in number. It thus includes the mackerels, frigate-mackerels, tunnies, bonitos, and Spanish mackerel.

They are numerous in tropical seas. By recent writers two subdivisions are ranked as genera. In the typical species the dorsal spines are seven in number, the pterygoids are armed with teeth, and the scales are normally developed. But in the American representative there are no pterygoid teeth, and the linear scales are embedded. Such is the character of the genus called *Oligoplites*, to which belongs the well-known leather-jacket, *O. occidentalis*, of both coasts of Central America and north to New York and California. It is bluish above, silvery below, with yellow fins.

=*Syn. 1.* *Scorch, Singe, Sear, Char, Parch.* To *scorch* is to burn superficially or alightly, but so as to change the color or injure the texture; sometimes, from the common effect of heat, the word suggests shriveling or curling, but not generally. *Singe* is one degree more external than *scorch*; we speak of *singeing* the hair and *scorching* the skin; a fowl is *singed* to remove the hairs after plucking out the feathers. *Sear* has primary reference to drying, but more commonly to hardening, by heat, as by cauterization; hence its figurative use, as when we speak of *seared* sensibilities, a *seared* conscience, heat not being thought of as

a part of the figure. To *char* is to reduce to carbon or a black cinder, especially on the surface: when a timber is charred it is burned black on the outside and to an uncertain depth. *Parch* has a possible meaning of burning superficially or roasting, as in *parched* corn or peanuts, but almost always refers to drying or shriveling.

8. A line drawn; a long superficial scratch or mark.

A letter's like the music that the ladies have for their spinets—naething but black *scores*, compared to the same tune played or sung. *Scott*, Heart of Mid-Lothian, xxvii. Specifically, the line at which a marksman stands in target-shooting, or which forms the "scratch" or starting-point in a race.

W. W. Greener, The Gun, p. 506.

9. In *music*, a written or printed draft or copy of a composition on a set of two or more staves braced and barred together. In a *full* or *orchestral score*, a separate staff is assigned to each instrument and voice, so that it contains all that is indicated in all the instrumental or vocal parts taken together. A *vocal or piano score* is one in which the voice-parts are given in full, usually on separate staves, while the accompaniment is condensed into two staves for performance on a pianoforte or organ. An *organ score* is either the same as the last or one in which three staves are used, as in regular organ music. A *score* in which more than one part is written on a staff is called *short, close, or compressed*, especially in the case of four-part vocal music when written on two staves; but these terms are also occasionally applied to an abridged or skeleton transcription. In an orchestral *score* the various parts are usually grouped, so that instruments of the same class appear together. The usual arrangement is (read downward) wood wind (flutes, oboes, clarinets, bassoons), brass wind (horns, trumpets, trombones), percussives (tympani, cymbals), upper strings (violins, violas), voices (soprano, alto, tenor, bass), lower strings (violin-cellos, double basses); but considerable variations from this order occur. The arts of reading from a full *score*, and of transcribing for the pianoforte from such a *score*, are among the most difficult branches of musical accomplishment. Also *partition*.

I use the phrase in *score*, as Dr. Johnson has explained it in his Dictionary: "A song in *score*, the words with the musical notes of a song annexed." But I understand that in scientific propriety it means all the parts of a musical composition noted down in the characters by which it is exhibited to the eye of the skillful.

Scorpenidae (skôr-pē-ni-dē), *n. pl.* [NL., < *Scorpena* + *-idae*.] A family of acanthopterygian fishes, typified by the genus *Scorpena*, to which different limits have been assigned. (a) In Günther's system, a family of *Acanthopterygii perciformes* with perfect or nearly perfect ventrals, and a bony stay for the angle of the preoperculum, which is armed, this stay arising from the infraorbital ring. (b) In Gill's system, those *Scorpenoidea* which have the dorsal fin consisting of an elongated spinigerous and short arthropterous section; well-developed thoracic or post-thoracic ventrals; head moderately compressed; branchial apertures extending forward and not separated by an isthmus; and a dorsadiform (or nuchadiform) trunk. The scorpenoids resemble percoids, having the body oblong, more or less compressed, with usually large head and wide terminal mouth, and ridges or spines on the top and also on the opercles. A bony stay extends from the suborbital to the preopercle; the gill-slits are wide; the scales are ctenoid (sometimes cycloid); and the lateral line is single. The ventrals are thoracic, with one spine and typically five rays; the dorsal is rather long with numerous (from eight to sixteen) spines and about as many soft rays; the anal is rather short, with three spines and from five to ten rays. The pseudobranchiae are large, the pyloric caeca few (less than twelve in number), and an air-bladder is present. Over 20 genera and 200 species inhabit all seas; they are especially numerous in temperate regions of the Pacific ocean, where they form a large, conspicuous, and economically important feature of the piscifera. The northern species mostly live about rocks, and hence their most general name is *rockfish* or *rock-cod*. Many are viviparous, the young being born alive when about a fourth of an inch long; some of them attain a large size, and all are used for food. Besides *Scorpena*, notable genera which include American forms are *Sebastes*, *Sebastes*, and *Sebastes*, including a great variety of rockfish or rock-cod, mainly of the Pacific coast, known as *rose-fish*, *snapper*, *bocaccio*, *merou*, *priest-fish*, *ciuva*, *garrupa*, *flaum*, *rasher* or *rasciera*, *lanbor*, *corsair*, *fly-fish*, *rena*, *Spanish-flag*, *tree-fish*, etc. See the generic and vernacular names, and cuts under *priest-fish*, *rockfish*, *Sebastes*, *Spanish-flag*, *corsair*, and *Scorpena*.

A scorpenoid fish, *Scorpena guttata*. The cheeks, opercle, and top of the head are naked, the breast is scaly, and the color is brown mottled and blotched with rosy purplish and pale olive. It is about a foot long, and is abundant on the southern Californian coast, where it is also called *sculpin*. See cut under *Scorpena*.

scorper (skôr-pēr), *n.* [A misspelling of *scupper*.] *1.* In wood- and metal-work, a form of gouging-chisel for working in hollows, as in forming bowls and in undercutting carvings, etc.—*2.* A pointed, flat, or rounded steel tool

with a sharp edge, set in a wooden or other handle, used by the jeweler for drilling holes and cutting away parts of the metal-work around settings to hold precious stones.

scorpiact (skôr-pi-ak), *a.* [< MGr. *σκόρπιακός*, pertaining to a scorpion, < Gr. *σκόρπιος*, a scorpion: see *scorpion*.] Of or pertaining to a scorpion; figuratively, stinging.

To wound him first with arrows of sharp-pointed words, and then to sting him with a scorpiack censure.

Hacket, *Life of Williams*, l. 82. (Davies.)

Scorpidinae (skôr-pi-di-nē), *n. pl.* [NL., < *Scorpius* (-pid-) + *-inae*.] A subfamily of fishes, typified by the genus *Scorpius*. It was introduced by Gill for *Pimblepteridae* with the front teeth incisor-like but without

Medialuna (*Caesioma californiensis*), one of the *Scorpidinae*.

roots extending backward, with teeth on the vomer, and the soft fins densely scaly. Few species are known. One, *Caesioma californiensis*, occurs along the Californian coast.

Scorpio (skôr-pi-ō), *n.* [L. NL.: see *scorpion*.] *1.* In *zool.*, a Linnean genus of arachnidans, equivalent to the modern order *Scorpionida*, used with various restrictions, now the type of the limited family *Scorpionidae*. See *scorpion*.—*2.* A constellation and the eighth sign of the zodiac, represented by the character ♏. The constellation, which is prominent in early summer in the skies of the southern United States (where the whole of the magnificent tail clears the horizon), contains the first-magnitude red star Antares and several of the second magnitude. With the Chaldeans and Greeks it extended over one sixth of the planetary circle, the scorpion being represented with exaggerated claws embracing a circular space where Libra is now placed. From this irregularity it may be inferred that the constellation is older than the zodiac, which was formed before 2000 B. C. Libra, though later, is of no small antiquity, since it appears in the Egyptian zodiacs. Its adoption by Julius Caesar in his calendar made it familiar. Ptolemy, however, though living in Egypt nearly two centuries later, follows Babylonian and Greek astronomers in covering the place of Libra with the scorpion's claws. In designating the stars of this constellation by means of the Greek letters, the genitive *Scorpii* (from the alternative Latin form *scorpius*: see *scorpion*) is used: thus, Antares is a *Scorpii*.

Scorpiodea, **Scorpioidea** (skôr-pi-ō-dē-ō, -oi-dē-ō), *n. pl.* [NL.: see *scorpioid*.] Same as *Scorpionida*. **scorpioid** (skôr-pi-oid), *a.* [< Gr. *σκόρπιοειδής*, contr. *σκόρπιώδης*, like a scorpion, < *σκόρπιος*, a scorpion, + *-ειδής*, form.] *1.* In *zool.*: (a) Resembling or related to a scorpion; belonging to the *Scorpionida*. (b) Rolled over or curled like the tail of a scorpion; cincinnal; coiled in a flat spiral.—*2.* In *bot.*, curved or circinate at the end, like the tail of a scorpion; rolled up toward one side in the manner of a crozier, unrolling as the flowers expand, as in some of the *Boraginaceae*. See cut in next column.

also *scorpius*, < Gr. *σκόρπιος* (later also *σκόρπιον* in sense of a military engine), a scorpion, also a prickly sea-fish, a prickly plant, the constellation so called, a military engine.] *1.* In *zool.*, an arthropod of the order *Scorpionida*. It has an elongated body; the cephalothorax is continuous with the abdomen, which ends in a long slender post-abdomen, which latter can be curled up over the back and is armed at the end with a sharp sting or telson, more or less hooked like a claw, and connected with a venom-gland, so that its puncture inflicts a poisoned wound. (See also cuts under *Buthus* and *Scorpionidae*.) The sting of a scorpion is painful, and is said to paralyze the organs of speech. The scorpion has also a large pair of nippers in front, like the great claws of a lobster, and the whole figure is suggestive of a little lobster, an inch or a few inches long. Scorpions abound in tropical and warm temperate countries. In the former they attain the maximum size of 8 or 10 inches, and are very formidable. They commonly lurk in dark retreats, as under stones and logs, and are particularly active at night. They are carnivorous and predaceous; they seize their prey with their nippers, and sting it to death. Scorpions are justly dreaded, but some popular beliefs respecting them have no foundation in fact, as that when the creature is surrounded by fire it stings itself to death rather than be burned, or that some fluid extracted from a scorpion will cure its sting.

Scorpion (*Scorpio afer*), seen from above.

A, the chelicerae, or chelate antennae; the large claws are chelate pedipalpi; *C/A*, cephalothorax; the first two legs are cephalic appendages, the next two thoracic; *Tn*, the telson or sting.

This is the *scorpion* that maketh uayr mid the heauede, and enueymeth mid the tayle.

Ayenble of Inuyt (E. E. T. S.), p. 62.

I lykne her to the *scorpion*,
That is a fals flatering beste;
For with his hede he maketh feste,
But al amynd his flatering

And enueyme.

And though I once despair'd of woman, now
I find they relish much of *scorpions*,
For both have stings, and both can hurt and cure too.

To cure the wounds the vermin made.

S. Buller, *Hudibras*, III. II. 1020.

Hence—*2.* Some creature likened to or mistaken for a scorpion, and poisonous or supposed to be so. (a) A false scorpion; any member of the *Pseudoscorpiones*. Among these arachnidans, belonging to the same class as the true scorpion, but to a different order, the members of the genus *Chelifer* are known as *book-scorpions*. (See *Cheliferidae*, and cut under *Pseudoscorpiones*.) Those called *whip-scorpions* are of the family *Telyphonidae*. (See cut under *Pedipalpi*.) Closely related to these, and sometimes sharing the name, are the *Phryniidae*. (See cut under *Phryniidae*.) (b) Centipedes and tarantulas are often confounded in the popular mind with scorpions, as are also (c) various small lizards, in the latter case probably from the habit some of them have of carrying their tails up. Thus, in the United States, some harmless lizards or skinks, as of the genera *Sceloporus* and *Eumeces*, are commonly called *scorpions*. (d) Same as *scorpion-bug*.

3. In *ichth.*, a scorpion-fish or sea-scorpion; one of several different members of the *Scorpenidae*, some of which are also called *scorpene* and *sculpin*. See cut under *Scorpena*, and etymology of *Scolopendra*.—*4.* [cap.] In *astron.*, the eighth sign of the zodiac, which the sun enters about October 23d. See *Scorpio*, *2*.

Th' Eternal, to prevent such horrid fray,
Hung forth in heaven his golden scales,
Yet seen betwixt Astraea and the Scorpion sign.

Milton, *P. L.*, iv. 998.

5. A kind of whip said to have been armed with points like that of a scorpion's tail; a scourge, described as having a handle of iron, or of wood braced and ferruled with iron, and two, three, or more chains attached, like the lashes of a whip, and set with balls, rings, or angled and pointed masses of iron.

My father hath chastised you with whips, but I will chastise you with scorpions. 1 Ki. xii. 11.

If the people resisted [Rehoboam], they should be punished not with whips, but with scorpions: that is, rods of knotted wood furnished with barbs, producing a wound like the bite of a scorpion.

Von Ranke, Univ. Hist. (trans.), p. 57.

6. An old military engine, used chiefly in the defense of the walls of a town. It resembled the ballista in form, consisting essentially of two beams with ropes stretched between them, from the middle of which ropes rose a third beam, called the *stylus*, so disposed as to be pulled back and let go at pleasure; to the top of this beam were fastened iron hooks to which a sling of iron or hemp for throwing stones was hung.

Heer crooked Corules, fleeing bridges tall,
Their scathfull Scorpions, that runes the wall.
Hudson, tr. of Du Bartas's Judith, iii.

He watched them at the points of greatest danger falling under the shots from the scorpions.

scorpion-fish (skôr'pi-on-fish), *n.* A fish of the family *Scorpenidae* and genus *Scorpena*; a sea-scorpion: so called on account of the spines of the head and fins. See cut under *Scorpena*.

scorpion-fly (skôr'pi-on-fli), *n.* A neuropterous insect of the family *Panorpidae*, and especially of the genus *Panorpa*: so called from the forceps-like apparatus at the end of the slender abdomen of the male, and the tendency of the abdomen to curl like the tail of a scorpion. *P. communis* is a European example. See cut under *Panorpa*.

scorpion-grass (skôr'pi-on-grās), *n.* A plant of the genus *Myosotis*; the forget-me-not or mouse-ear.

Scorpion-grass, the old name of the plant now called Forget-me-not. . . . It was called *scorpion-grass* from being supposed, on the doctrine of signatures, from its spike resembling a scorpion's tail, to be good against the sting of a scorpion.

Scorpionida (skôr-pi-on'i-dē), *n. pl.* [NL., < *Scorpiones + -ida.*] An order of *Arachnida*, having pulmotracheate respiration, the cephalothorax indistinctly segmented from the abdomen, a long jointed postabdomen ending in a hook or telson, and long maxillary palpi, or pedipalps, ending in a usually large chelate claw, or pincer; the true scorpions or *Scorpiones*. The ambulatory legs are seven-jointed, and of moderate and approximately equal lengths. The eyes are from six to twelve

in number. The falcies or chelicerae are well developed and pincer-like. There are four pairs of pulmotracheae. The long postabdomen or tail is very flexible, and is generally carried curled up over the back; the hook with which it ends is perforated for a poison-duct, and constitutes a sting, sometimes of very formidable character. The order is very homogeneous, and all the forms of it were formerly included in a single family, *Scorpionidae*, or even in the genus *Scorpio*. It has been divided, according to the number of eyes (six, eight, ten, or twelve), into *Scorpionidae*, *Telegonidae*, *Vejovidae*, and *Androctonidae*, and in other ways. From 1 to more than 30 genera are recognized. See cut for *Scorpionidae* above, and those under *Buthus* and *Scorpio*.

Scorpionidae (skôr-pi-on'i-dē), *n. pl.* [NL., < *Scorpio(n-)* + *-idae*.] A restricted family of scorpions, typified by the genus *Scorpio*. See cut in preceding column.

It has large creamy-white or lemon-colored flowers, resembling a spider, continuing to bloom long from the summit of the spike. 2. *Genista Scorpius* of southwestern Europe. More specifically called **scorpion-broom** and **scorpion-thorn**.

scorpion-shell (skôr'pi-on-shel), *n.* A gastropod of the family *Strombidae* and genus *Pteroceras*, distinguished by the development of long tubular or channeled spines from the outer lip of the aperture. About a dozen species are known, some a foot long, all inhabitants of the Indian seas and the Pacific, as *P. lambis*.

(Cuvier and Valenciennes, 1831), < Gr. *σκόρις*, a kind of sea-fish.] In *ichth.*, a genus of pimelepteroide fishes, variously limited, containing species of the southern Pacific. The northern fish formerly referred to the genus, the medalluna of California, a handsome fish a foot long and valued for food, belongs to the genus *Cænozona*. See cut under *Scorpiidae*.

Scorpiurus (skôr-pi-ū'rus), *n.* [NL. (Linnæus, 1737), < Gr. *σκόριον*, a plant so called, lit. 'scorpion-tailed,' < *σκόριος*, scorpion, + *οὐρά*, tail.] A genus of leguminous plants, of the suborder *Papilionaceæ*, tribe *Hedysareæ*, and subtribe *Coronilleæ*. It is characterized by flowers solitary or few on a leafless peduncle with beaked keel-petals, and a cylindrical, furrowed, and circinate coiled pod, which is commonly warty or prickly and does not split open, but breaks across into joints containing roundish seeds with remarkably twisted and elongated seed-leaves. There are about 6 species, natives especially of the Mediterranean region, extending from the Canary Islands into western Asia. They are stemless or decumbent herbs, with entire and simple leaves, unlike most of the family in this last respect, and with small yellow nodding flowers. They are curious but not ornamental plants; their rough coiled pods, called "caterpillars," are sometimes used to garnish dishes. The species have been named *scorpion's-tail* and *caterpillar-plant*.

Sp. *escorzonera* (so named from the use of the root as a remedy for snake-bites), < *escorzon*, snake-poison.] 1. A genus of composite plants, of the tribe *Cichoriaceæ*, type of the subtribe *Scorzonereæ*. It is characterized by flowers with involucre bracts of many gradually increasing series, plumose and unequal pappus of many rows, and many-ribbed achenes without a beak and commonly without wings. There are about 120 species, natives especially of the Mediterranean region, extending into central Asia. They are smooth, woolly, or bristly plants, generally perennials, bearing alternate and grass-like or broader and dissected leaves, and rather large long-stalked heads of yellow flowers. The best-known species is *S. Hispanica*, the black salsify, much cultivated, chiefly in Europe, for its root, which is used as a vegetable, and has, when moderately boiled, the remedial properties of dandelion. *S. deliciosa* of Sicily is said to be equal to salsify, and *S. crocifolia* in Greece is a favorite salad and spinach. *S. tuberosa* and perhaps other eastern species afford an edible root. An old name of *S. Hispanica* is *viper's-grass*. 2. [*l. c.*] A plant of this genus.

Scythia*, *Scythes*, a Scythian, said to mean 'wanderer,' 'nomad,' or, according to an old view, 'an archer' (see *Scythian*); (c) to Gr. *σκόρος*, darkness (the LL. *Scotus*, prop. *Scôtus*, being taken in this view as *Scôtus*, with a short vowel) (see *scotia*). Hence the surname *Scott*, formerly also spelled *Scot*, ME. *Scott*, *Scot*, D. *Schot*, G. *Schott*, OF. *Scot*, *Escot*, etc., ML. *Scotus* (as in *Duns Scotus*), etc., one of the few mod. surnames orig. tribal or national names (others are *Britt*, *Brett*, or *Bret*, *Briton*, *Britton*, or *Britten*, *Saxon*, *Dane*); cf. the surnames *English*, *Irish*, *French*, G. *Deutsch*, *Deutscher*, etc., orig. adj.] 1. Part of the immunity which the outlaws enjoyed was no doubt owing to the connivance of the officers of the forest, who levied forced contributions from them, and compelled all who feared their displeasure to drink at ale-houses which they kept, this extortionate practice being known as *Scothala* or *Scotshale*. These exactions were curbed by the Statute of Fines Levied (27 Ed. I. A. D. 1299), which enacted that, "No Forester or Bedel from henceforth shall make *Scotal*, or gather garb, or oats, or any corn, lamb, or pig, nor shall make any (gathering but) by the sight and upon the (view) of the twelve Rangers, when they shall make their (range)."

His method is the logical analysis of the elements of existence. His fundamental doctrine is that distinctions which the mind inevitably draws are to be considered as real, although they do not exist in the things apart from their relations to mind. Such distinctions were called *formal*, the abstractions thence resulting *formalities*, and those who insisted upon them *formalists* or *formalizers* (Middle Latin *formalistas*). He taught the important principle of *hæcceity*—that individual existence is no quality, is capable of no description or general conception, but is a peculiar element of being. He held that the natures of genera and species, as *animal* and *horse*, are real, and are not in themselves either general or particular, though they cannot exist except as particular nor be thought except as general. The teaching of Scotism in the English universities was prohibited by the royal injunctions of 1535.

(c) An architecturally decorated wall inclosing a courtyard or the like. mechanical powers, and is virtually a spiral inclined plane—only, the inclined plane is commonly used to overcome gravity, while the screw is more often used to overcome some other resistance. Screws are *right* or *left* according to the direction of the spiral. They are used (1) for balancing forces, as the jack-screw against gravity, the propeller-screw against the resistance of water, ordinary screws against friction in fastening pieces together, the screw-press against elasticity, etc.; and (2) for magnifying a motion and rendering it easily manageable and measurable, as in the screw-feet of instruments, micrometer-

screws, etc. For the pitch of a screw, see *pitch*, 1. 7 (b). See also *leading-screw*, *leveling-screw*.

Courper, Truth, I. 385.

10. A professor or tutor who requires students to work hard, or who subjects them to strict examination. [College slang, U. S.]—11. Wages or salary. [Slang.]

He had wasted all his weekly *screw*,
And was in debt some shillings besides.

Australian Printers' Keenpicks. (Leland.)

12. In *math.*, a geometrical form resulting from the combination of an axis, or straight line given in position, with a pitch or linear magnitude.—**Archimedean screw**. See *Archimedean*. — **A screw loose**, something defective or wrong, as with a scheme or an individual.

My uncle was confirmed in his original impression that something dark and mysterious was going forward, or, as he always said himself, "that there was a *screw loose* somewhere."

Dickens, Pickwick, xlix.

Auxiliary screw, a screw propeller in a vessel having sail-power as her main reliance, generally so fitted that it can be hoisted clear of the water when not in use. See cut under *banjo-frame*. — **Auxiliary steering-screw**, a secondary screw exerting its force at an angle with the plane of symmetry of a vessel, and used to increase a vessel's manageableness. — **Back-center screw**. See *back-center*. — **Backlash of a screw**. See *backlash*. — **Blake's screw**, a screw-bolt having an eye in one end and a screw-thread cut in the other; an eye-bolt. — **Compound, coreciprocal screw**. See the adjectives. — **Differential screw**, an arrangement consisting of a male screw working in a female screw and having a female screw cut through its axis with a different pitch, a second male screw working in this. If the hollow screw is turned while the inner one is prevented from turning, the latter advances proportionally to the difference of the pitches. — **Double screw**, a screw which has two consecutive spiral ridges or threads, both having the same pitch. — **Endless screw**. See *endless*. — **Female screw**. See *female*. — **Flat screw**, a spiral groove cut in the face of a disk, which by its revolution communicates a rectilinear motion to a sliding bar carrying a pin which works in the groove.

— **Fossil screw**. See *fossil* and *screwstone*. — **Hindley's screw**, a screw cut on a solid, of such form that if any plane be taken through its longitudinal axis, the intersections of the plane by the perimeter are arcs of the pitch-circle of a wheel into which the screw is intended to work. It is so named from having been first employed by Mr. Hindley of York in England. — **Hunter's screw** (named from its inventor, Dr. John Hunter), a double screw consisting of a principal male screw that turns in a nut, but in the cylinder of which, concentric with its axis, is formed a female screw of different pitch that turns on a secondary but fixed male screw. The device furnishes a screw of slow but enormous lifting power without the necessity of finely cut and consequently frail threads. Everything else being equal, the lifting power of this screw increases exactly as the difference between the pitches of the principal male screw and the female screw diminishes, in accordance with the principle of virtual velocities. — **Interior screw**. See *interior*. — **Interrupted screw**, in *mach.*, a screw part or parts of whose thread are cut away, rendering it discontinuous; specifically, a screw whose exterior is divided into six

equal parts, with the screw-threads removed from alternate sectors, used to form the closure of a breech-loading cannon. In some cases the interruptions extend entirely around the screw, so that, in the common parlance of mechanics, "every other thread" is removed. Such a screw will turn perfectly in a nut of sufficient length. See cut under *cannon*.—**Involution of six screws.** See *involution*.—**Left-handed screw,** a screw which is advanced by turning from right to left, in contradistinction to the usual or *right-handed screw*, which turns in the opposite direction.—**Male screw.** See *male*.—**Metric screw,** a screw in which the pitch is commensurable in units or fractions of a unit of the French metric system.—**Milled screw,** a screw with a flat broad head the edge of which is fluted, crenated, or roughened, to afford a firm hold for the fingers. Such screws are much used in chemical, philosophical, and electrical instruments, and in small machines.—**Perpetual screw.** Same as *endless screw* (which see, under *endless*).—**Plane screw.** See *plane*.—**Portland screw,** the cast of the interior of a fossil shell, *Cerithium portlandicum*. It consists of a number of spiral metal blades either cast together in one piece or bolted to a hub. In some special cases, as in ferry-boats, there are two screws, one at each end of the vessel. In some war-vessels transverse shafts with small propellers have been used to assist in turning quickly. An arrangement of screws now common is the twin-screw system, in which two screws are arranged at the stern, each on one of two parallel shafts, which are driven by power independently of the other. By stopping or slowing up one shaft while the other maintains its

velocity, very rapid turning can be effected by twin screws, which have, moreover, the advantage that, one being disabled, the vessel can still make headway with the other. Some vessels designed to attain high speed have been constructed with three screws. A very great variety of forms have been proposed for screw-propeller blades; but the principle of the original true screw is still in use. Variations in pitch and modifications of the form of the blades have been adopted with success by individual constructors. The actual area of the screw propeller is measured on a plane perpendicular to the direction in which the ship moves. The outline of the screw projected on that plane is the actual area, but the effective area is, in good examples, from 0.2 to 0.4 greater than this; and it is the effective area and the mean velocity with which the water is thrown astern that determine the mass thrown backward. The mass thrown backward and the velocity with which it is so projected determine the propelling power. A kind of feathering propeller has also been used, but has not been generally approved. It is characterized by flowers with a deeply five-cleft calyx, a nearly globose corolla with four short, flat, erect lobes and one spreading in front, four stamens with one-celled anthers, and often a scale-like staminode representing a fifth stamen. The fruit is a rigid two-celled septicidal capsule, roundish and commonly sharp-pointed, containing very numerous wrinkled seeds. There are about 120 species, chiefly Old World plants of the Mediterranean region, also extending widely through the north temperate zone, but very sparingly in America, where 3 species occur in the western United States, one of which, *S. nodosa*, figwort, extends to the Atlantic and to Canada. They are smooth or bristly herbs, sometimes shrubby, and often fetid. They bear leaves which are chiefly opposite, and are often covered with pellucid dots, and loose cymes of greenish, purplish, or yellow flowers disposed in a terminal thyrsus. The species are known as *figwort*, especially *S. aquatica* of England, also called *water-betony*, *bullwort*, and *bishop's-leaves*, and *S. nodosa*, a widely diffused species of Europe and America, used formerly in medicine in the treatment of scrofula, and occasionally still in making ointments for ulcers, etc. See *brunwort*.

Scrophularineæ (skrof'ū-lā-rin'ē-ē), *n. pl.* [NL. (Bentham, 1835), < *Scrophularia* + *-ineæ*.] An important order of gamopetalous plants, of the cohort *Personales* in the series *Bicarpellatæ*, distinguished by a completely two-celled ovary with its placenta on the middle partition, and by numerous seeds with fleshy albumen. The flowers have usually a persistent five-lobed calyx, a personate and irregularly inflated two-lipped corolla, four didynamous stamens borne on the corolla-tube, often with a staminode representing a fifth stamen, and an entire and sessile ovary which becomes a capsule opening by lines or terminal chinks, or rarely succulent and forming a berry. The order includes about 2,000 species, of 166 genera and 12 tribes, by many grouped in 3 series—the *Pseudolanææ*, with alternate leaves and flatish flowers, as the mullen, transitional to the *Solanaceæ* or nightshade family; the typical section, the *Antirrhinidæ*, as the snapdragon, with opposite lower leaves and the upper lip exterior in the bud; and the *Rhinanthidæ*, including the foxglove and *Gerardia*, with various leaves and the lower lip exterior. The species are mainly herbs—a few, as *Paulownia*, becoming trees. Their leaves are entire or toothed, seldom lobed, and always without stipules. The inflorescence is either perfectly centripetal, commonly racemose, or primarily centripetal, the branches however bearing centrifugal clusters, either axillary or forming together a thyrsus. In some exceptional genera the corolla is spreading and nearly flat (see *Veronica*, *Verbascum*, *Limonella*); in many others the typical personate form becomes altered to a funnel-shaped or bell-shaped body, or to an inflated pouch or sac, often with a conspicuous spur. The order is well distributed through all parts of the world; it is most frequent in temperate and montane regions, but is also found within both arctic and tropical climates. About 50 genera are peculiar to America, over half of which belong to North America only; about 23 are confined to South Africa, 15 to Asia, and the others are mostly more widely diffused; 88 genera and about 340 species occur in the United States—one, *Veronica*, extending within the arctic circle. Most species are arid and bit-

ter, and of suspicious or actively poisonous properties; many, as *Scrophularia* (the type), *Fraxinea*, etc., yield remedies formerly or at present in repute. Several genera, as *Buchnera* and *Gerardia*, show a marked tendency to parasitism, dry black, resist cultivation, are in various species leafless, and connect with the parasitic order *Orobanchaceæ*. Others yield some of the most ornamental flowers of the garden. For the principal types of tribes, see *Verbascum*, *Calceolaria*, *Antirrhinum*, *Chelone*, *Gratiola*, *Digitaria*, *Gerardia*, and *Euphrasia*. The scrotum is a double bag, whose two cavities are separated by the septum scroti, which is indicated on the surface by a median seam or raphe. It consists of two layers—the skin, or integumentary layer, and the contractile layer, or dartos. The integument is very thin, brownish, provided with hairs and sebaceous follicles, and more or less corrugated or rugose, owing to the contraction of the dartos, which is a vascular layer containing a large amount of non-striated muscular tissue. All mammals whose testes leave the abdominal cavity have a scrotum, but in position, as well as in other particulars, it differs much in different cases. It is perineal, as in man, monkeys, dogs, etc.; or inguinal, as in the horse, bull, etc.; or abdominal, as in marsupials, in the position of the mammary pouch of the female. It may be sessile and little protuberant, or pendulous by a narrow neck, as in the bull, marsupials, etc.—**Raphe of the scrotum**. See *raphe*.

That of the mesonotum (specifically the mesoscutellum, which see) is the most important in classification, and is generally meant when *scutellum* is said without qualifying term. the feet of most birds are provided, and which are generally arranged in a single vertical series upon the front, often also upon the back, of the tarsus and the tops of the toes: distinguished from the smaller or irregular plates which collectively constitute reticulation. The presence of such scutella constitutes scutellation, and a tarsus so furnished is said to be scutellate, as opposed to either a booted or a reticulate tarsus. The presence of scutella upon the back of the tarsus constitutes scutellipantation—a condition rare in oscine birds, though usual in non-oscine *Passeres*, in *Picariæ*, etc. Also written *scutella*, with a plural *scutellæ*.—**Abdominal scutella**, distinct scutellum, received scutellum. Some compare the word with *L. sævus*, wild, cruel, or with Gr. *αἰδώς*, movable; but there is no evidence to show that the name orig. implied 'raging water' or 'moving water.' 1. The salt waters that cover the greater part of the earth's surface; the ocean. [The word *sea* in compound words always has the meaning of 'ocean.' In this sense, with a hyphen, the word is the first element of numerous names, especially of animals and plants, the more noteworthy of which are entered in the following columns.]

The thrille day thei rode forth to the Rochell, and ther entred the *see*.

Martin (E. E. T. S.), iii. 419.

The sun's a thief, and with his great attraction

Robs the vast *sea*.

Shak., T. of A., iv. 3. 440.

2. A great body of salt water; a more or less distinctly limited or landlocked part of the ocean having considerable dimensions. Such seas are frequently limited or separated from each other by linear groups of islands; this is especially the case on the Pacific coast of Asia, and in the East Indies, where there are more seas in this sense than anywhere else. Smaller areas thus more or less completely inclosed by land are known as *bays*, *gulfs*, *sounds*, etc. Thus, we speak of the Mediterranean Sea and, as a smaller division of this, the Adriatic Sea; but of the Gulf of Taranto, and the Bay of Naples. The name *sea* is not now usually given to entirely landlocked sheets of water—such use being either traditional, as in the Dead Sea, Sea of Galilee, or exceptional, as in the Caspian Sea, Sea of Aral. *Sea*, *bay*, and *gulf* are more or less synonymous terms. Thus, the Arabian Sea and the Bay of Bengal do not differ essentially in

the extent to which they are landlocked: the same may be said of the *Gulf of Mexico* and the *Caribbean Sea*; and *Hudson's Bay* might equally well, or even more properly, be called *Hudson Sea*.

And this deed See hath in brede est and west .v. legges, and in lengthe northe and southe .v. dayes journey, and nyghe unto the sayd see it is comonly darke as hell.

4. The swell of the ocean, or the direction of the waves: as, there was a heavy sea on; to keep the boat's head to the sea.

5. A large wave; a billow; a surge: as, to ship a sea.

A long sea, a sea having a uniform and steady motion of long and extensive waves.—*Arm of the sea*, a stretch of the sea extending inland: in law it is considered as extending as far into the interior of a country as the fresh water of rivers is propelled backward by the ingress and pressure of the tide. *Angell, On Tide Waters, iii.—At full sea*, at high water; hence, at the height.

sea-breeze (sē'brēz), *n.* A breeze blowing from the sea toward the land; specifically, in *meteor.*, a diurnal breeze felt near the sea-coast, setting in from the sea about 10 A. M., reaching its greatest strength from 2 to 3 P. M., and dying away about sunset. The sea-breeze and the corresponding land-breeze together constitute a local to-and-fro circulation due to the heating of the land above the ocean temperature during the day and the cooling below it during the night. The upper strata of the air that have become heated and expanded flow off seaward, and produce an increased pressure a short distance from the land. This increment of pressure initiates the sea-breeze, which extends a few miles inland, with a strength depending on the temperature-gradient and on the local topography. Hence it is most strongly marked in equatorial and tropical regions, where the diurnal range of temperature and the contrasts between ocean and land temperatures are greatest; but traces of it have been found even in arctic regions. Steep slopes and mountain-ranges near the coast intensify the sea-breeze by increasing the energy of convection-currents, which in turn create a demand for a greater local surface draft. By balloon observations the depth of the sea-breeze at Coney Island has been found to be between 300 and 400 feet. It is mainly the daily sea-breeze which renders the summer climate of the sea-shore markedly invigorating and refreshing.

seal¹ (sēl), *n.* [Also *Se*. 'of the sea'; cf. Gr. *ἄλς*, *L. sal*, the sea: see *sal*¹ and *sal*¹.] 1. A marine carnivorous mammal of the order *Peræ*, suborder *Pinnipedia*, and family *Phocidae* or *Otariidae*; any pinniped not a walrus—for example, a hair-seal, a fur-seal, an eared seal, of which there are numerous genera and species. Seals are regarded as carnivores modified for aquatic life. The modification is profound, and somewhat parallel with that which causes certain other mammals, the cetaceans and sirenians, to resemble fishes in the form of the body and in the nature of the limbs. But seals retain a coat of hair or furlike ordinary quadrupeds, and an expression of the face like that of other carnivores. The body is more or less fusiform, tapering like that of a fish. It is prone, and can scarcely be lifted from the ground, so short are the limbs. These are reduced to mere flippers, especially in the true *Phocidae*, in which the hind legs extend backward and cannot be brought into the position usual to mammals, but resemble the flukes of a cetacean. In the otaries (*Otariidae*) the limbs are freer and less constrained. The latter have small but evident external ears, wanting in the former. The monk-seal, *Monachus albicenter*, lives in the Mediterranean and neighboring Atlantic, and a related species, *Monachus tropicalis*, is found between the tropics in Central American and West Indian waters. Another seal, *Phoca caspica*, inhabits inland waters of the Caspian, Aral, and Balkal. But with few exceptions all seals are maritime and also extratropical. They are especially numerous in high latitudes of the northern hemisphere. Among the *Phocidae* may be noted *Phoca vitulina*, the ordinary harbor seal or sea-calf, common in British waters and along the Atlantic coast of the United States; it is often tamed and exhibited in aquaria, being gentle and docile, and capable of being taught to perform some amusing tricks; it is one of the smaller species, usually from 3 to 5 feet long, and being the best-known, as well as wide-ranging, it has many local and fanciful names. *Phoca groenlandica* (*Pagophilus groenlandicus*) is the Greenland seal, or harp-seal or saddleback, peculiarly colored, of large size, and an important object of the chase. *Pagomys fatidus* is a smaller species, the ringed seal or floe-rat of Greenland. *Erynnathus barbatus* is the great bearded or square-flipped seal of Greenland, attaining a length of 8 or 10 feet. *Halichærus gryphus* is a great gray seal of both

don, *Stenorhynchus* (or *Ommorhinus*), *Leptonychotes* (formerly *Leptonyx*), and *Ommatophoca*, form the subfamily *Stenorhynchinae*; some of these are known as *sea-leopards*

from their spotted coloration, and others as *sternicks*. All the foregoing are *Phocidae*, or earless seals, and they are also hair-seals. But the distinction between hair-seals and fur-seals is not, properly, that between *Phocidae* and *Otariidae*, but between those members of the latter family which do not and those which do have a copious under-fur of commercial value. The larger otaries are of the former character; they belong to the genera *Otaria*, *Eumetopias*, and *Zalophus*, are of great size, and are commonly called *sea-lions*; they are of both the northern and the southern hemisphere, chiefly in Pacific waters, and do not occur in the North Atlantic. The southern fur-seals or sea-bears are species of *Arctocephalus*, and among the smaller otaries. The fur-seal of most economic importance is the North Pacific sea-bear, *Callorhinus ursinus*. Some genera of fossil seals are described. See cuts under *Cystophorinae*, *Erynnathus*, *Eumetopias*, *fur-seal*, *harp-seal*, *clary*, *Pagomys*, *Phoca*, *ribbon-seal*, *sea-elephant*, *sea-leopard*, *sea-lion*, and *Zalophus*.

2. In *her.*, a bearing representing a creature something like a walrus, with a long fish-like body and the head of a carnivorous animal.—**Pied seal**. Same as *monk-seal*. See def. 1.

Cf. *sigil*, directly from the L.] 1. An impressed device, as of a letter, cipher, or figure, in lead, wax, paper, or other soft substance, affixed to a document in connection with or in place of a signature, as a mark of authenticity and confirmation, or for the purpose of fastening up the document in order to conceal the contents. In the middle ages seals were either impressed in wax run on the surface of the document, or suspended by cord or strips of parchment, as in the papal bulls. (See *bull*², 2.) In some jurisdictions an impression on the paper itself is now sufficient, and in others the letters *L. S.* (*locus sigilli*, the place of the seal) or a scroll or a mere bit of colored paper (see def. 3) are equivalent. In the United States the seal of a corporation or of a public officer may be by impression on the paper alone.

Great seal, a seal of state. The great seal of the United Kingdom of England and Scotland is used in sealing the writs to summon Parliament (Irish members included), also in sealing treaties with foreign states, and all other papers of great importance affecting the United Kingdom. The Lord Chancellor is the official custodian of the great seal; during a vacancy in the chancellorship it rests with an officer of equal dignity styled the Lord Keeper. The great seal of Ireland is used in the same manner as before the Union in 1800, except in the matter of summoning Parliament, etc. There is also a seal in Scotland for sealing grants and writs affecting private rights there. The great seal of the United States is placed in the custody of the Secretary of State; State seals usually are in the charge of the State secretaries.—*Hermetic seal*. See *hermetic*.—*Keeper of the Privy Seal*, or *Lord Privy Seal*. Astronomically the year is divided into four nearly equal seasons, spring, summer, autumn, and winter, reckoned solely with respect to the sun's motion—spring beginning when the sun crosses the equator going northward, summer when it reaches the summer solstice, autumn when it crosses the equator going southward, and winter when it reaches the winter solstice. But popularly and historically the seasons refer to the four well-marked periods which in temperate regions are exhibited in the annual changes of climate and stages of vegetation. Within the tropics the annual variation of temperature is not so marked as that of humidity and rainfall, and, according to the locality, sometimes two, sometimes three, and sometimes four climatic seasons are distinguished, termed the *rainy season*, the *dry season*, etc.

It consisted of a wooden body about 6 feet long, flat in front, polygonal behind, and tapering from a somewhat large flat base, which could be rested on the floor, to a short thick neck, terminating in a head with a tuning-screw. It had but one large string, made of gut, stretched over a peculiar bridge, and tuned to a low pitch, usually about that of the second C below middle C. The bridge was made so as to rest firmly on only one foot, the other being free to vibrate upon the body. The instrument was played with a large bow, like that of a violoncello. The tones used were the natural harmonics of the string, produced by lightly touching the nodes. Its scale therefore coincided with that of the trumpet; and this fact, taken in connection with its general shape, probably suggested its name. It was used for both sacred and secular music, both alone and in sets of three or four. It was especially common in numerus as an accompaniment for singing, since its tones corresponded in pitch with those of the female voice. The latest specimens date from early in the eighteenth century. The instrument is important in connection with the development of the viol. Also *marine trumpet*, *tromba marina*, *mus-jiddle*, etc.

Such structures are almost universal among the higher vertebrates, and of many special kinds, though all of one general character. In man they are especially notable on the face, being represented by the pores in the skin, which when stopped with a morbidly consistent secretion produce the unsightly black specks called *comedones*. The Meibomian follicles of the eyelids, the preputial follicles of the penis, the anal or subcaudal pouch of the badger, etc., are similar structures. The rump-gland of birds is an enormous sebaceous gland. (See *elæodochna*.) The mammary glands are allied structures, and apparently derived from sebaceous glands. The scent-glands of various animals, as the musk, beaver, civet, badger, etc., are all of like character. They serve to keep the skin in order, attract the sexes, repel enemies, etc. See *castor*, *civet*, *musk*, and cut under *hair*.—**Sebaceous humor**, an oily matter secreted by the sebaceous glands, which serves to lubricate the hairs and the skin. (d) In a scale, the second tone from the bottom: solmized *re*. Such a second is called *major*, and also the *greater* or *acute major second*, to distinguish it from the second between the second and third tones of the scale, whose ratio is 9:10, and which is called the *less* or *grave major second*. Both of these contain two half-steps. A second a half-step shorter than the above is called *minor*; and one a half-step longer is called *augmented*. All kinds of seconds are classed as dissonances. Both varieties of major second are also called *whole steps*, *whole tones*, or simply *tones*; and a minor second is also called a *half-step* or *semitone*. See *interval*. (e) A second voice or instrument — that is, one whose part is subordinate to or lower than another of the same kind; specifically, a second violin or second soprano; popularly, an alto. All this, however, is now discarded as inconsistent with fact; since yellow is not a primary color, the mixture of blue and yellow is never more than greenish, and often pink, etc. — **Secondary consciousness**, reflective consciousness; consciousness trained to self-observation. — **Secondary conveyance**, in *law*, same as *derivative conveyance*. See *conveyance*. — **Secondary creditor**. The secondary qualities are properly fourteen in number—namely, heavy and light, dense and rare, thick and thin, hard and soft, sticky and friable, rough and smooth, coherent and slippery. Color, smell, and taste are also secondary qualities. (b) In *modern philos.*, since Galileo (who in 1623 calls the qualities known as primary “*primi accidenti*”) and Boyle (who in 1663 uses the term “secondary qualities, if I may so call them.” in precisely the modern signification), affections of bodies; affective, patible, sensible qualities; imputed qualities; qualities of bodies relative to the organs of sense, as color, taste, smell, etc.: opposed to those characters (called *primary qualities*, though properly speaking they are not qualities at all) which we cannot imagine bodies as wanting. This classification was improved by Werner, who intercalated a “*Transition series*” between the primary and the secondary. See *Mesozoic*, *Paleozoic*, *Tertiary*, and *Transition*.

The last four of the italicized words, and in their primary sense the participles, express intentional concealment; the others do not. **Secret** is the most general, but expresses complete concealment. **Latent**, literally lying concealed, may mean hidden from those most concerned: as, I had a latent sense, feeling, or desire; hence its appropriateness in the expression *latent heat*. **Private** (as, it was kept strictly private) emphasizes the fact that some know the thing in question, while others are kept in ignorance.

Covert — that is, covered — suggests something underhand or well put out of sight: as, a covert motive, sneer, irony: it is opposed to *frank* or *avowed*. **Occult** suggests mystery that cannot be penetrated: as, the occult operations of nature; occult arts. **Clandestine** is now always used for studious or artful concealment of an objectionable or dishonorable sort: as, a clandestine correspondence: it applies especially to action.

3. An officer of state who is charged with the superintendence and management of a particular department of government. (a) In the British government there are five secretaries of state — namely,

those for the home, foreign, colonial, war, and Indian departments. The Secretary of State for the Home Department has charge of the privy signet office, and is responsible for the internal administration of justice, the maintenance of peace in the country, the supervision of prisons, police, sanitary affairs, etc. The Secretary of State for Foreign Affairs conducts all correspondence with foreign states, negotiates treaties, appoints ambassadors, etc. The Colonial Secretary performs for the colonial dependencies similar functions to those of the Home Secretary for the United Kingdom. The Secretary of State for War, assisted by the commander-in-chief, has the entire control of the army; the office dates from 1855, when the office of Secretary at War was merged into it. The Secretary for India governs the affairs of that country with the assistance of a council. Each secretary of state is assisted by two under-secretaries, one permanent and the other connected with the administration. The Chief Secretary for Ireland is not a secretary of state, though his office entails the performance of duties similar to those performed by the secretaries of state. (b) In the United States government six of the executive departments are presided over by secretaries — namely, the Secretary of State, the Secretary of the Treasury, the Secretary of War, the Secretary of the Navy, the Secretary of the Interior, and the Secretary of Agriculture — all members of the cabinet; their duties are described under the names of their respective departments. (See *department*.) Each State has also its Secretary of State, or corresponding officer.

secretary-bird (sek-rē-tār-i-bērd), *n.* A remarkable raptorial bird of Africa, with very long legs; the serpent-eater or crane-vulture. This bird appears to have been first named *Sagittarius* by Vosmaer in 1769; it is *le secrétaire*, *le message*, and *le mangeur de serpents* of early French writers, and *Falco serpentarius*, *Vultur serpentarius*, *Otis secretarius*, and *Vultur secretarius* of ornithologists of the last century. Between 1797 and 1817 four different generic names were based upon this type (see *Sagittarius*); and since 1800 five specific names have been added (*reptilivorus*, *africanus*, *capensis*, *gambiensis*, and, erroneously, *philippensis*) — the various combinations of the New Latin generic and specific names being now about twenty. The earliest tenable generic name (see *onym*) is *Serpentarius* of Cuvier; the earliest tenable specific name is *serpentarius* (Miller, 1785). Some strict constructionists of nomenclatorial rules would combine these in the tautology of *Serpentarius serpentarius*, a form which has been introduced sparingly into the present work, simply to recognize its existence. The next specific name in chronological order is *secretarius* of Scopoli, 1786, yielding with the proper generic name the unexceptionable

Secretary-bird (*Serpentarius secretarius*).

onym *Serpentarius secretarius*. The name *secretary* refers to the bird's crest, which when lying smoothly on the head has been likened to a scribe's pen stuck over the ear; and this is also the explanation of *Sagittarius*. The term *crane*

vulture (a reflection of Illiger's genus *Gypogeryon*) indicates the long legs like those of a gallatorial bird; *Serpentarius*, *Ophiophorus*, and *reptilivorus* describe the bird's characteristic habit of feeding upon snakes. Most of the remaining designations are place-names (one of them, *philippensis*, a blunder). The systematic position of this isolated type has been much discussed. It has usually been put in the *Raptores*, as a member of either of the families *Falconidae* or *Vulturidae*, or as forming a separate family called *Serpentariidae* or *Gypogeryonidae*. Cuvier put the bird among waders, next to the boat-billed herons (*Cancroma*). The late Dr. H. Schlegel of Leyden thought it was a goshawk, and called it *Astur secretarius*. The expert of the British Museum in the latest official lists locates it next to the cariamas (which is transferred to the family *Falconidae* on the strength of the supposed relationship). The appearance of the secretary-bird is somewhat suggestive of the hoatzin (see cuts under *hoatzin* and *Opiathocornus*). It is about 4 feet long from the tip of the bill to the end of the tail; the wing from the carpal joint to the point measures 25 inches; the tail is about as long as this, the tarsus 13½ inches. The general color is ashy-gray; the flight-feathers, the feathered part of the legs, and the lower belly are black; the breast and under wing- and tail-coverts are whitish, more or less shaded with ashy; the two middle tail-feathers are longer than the rest, white-tipped, and with subterminal black bar. There is a bare orange-yellow space about the eyes; the iris is hazel; the shanks are flesh-colored. The long crest of black or gray black-tipped feathers springs from the hindhead and nape; these feathers are somewhat spatulate, and dispart when the crest is erected under excitement. The serpent-eater has a very capacious gullet and crop, capable of holding at once several snakes two or three feet long; it also eats other reptiles, as lizards, frogs, toads, and young tortoises. It is said to attack large serpents by grasping them in its talons and striking blows with the wings until it can deal a decisive thrust with the beak upon the head of its prey. The bird has often been tamed by the Dutch colonists, and kept to rid their premises of vermin.

2. In *physiol.*: (a) In animal physiology, the process of preparing and separating substances by glandular activity. The product or secretion usually consists of substances previously existing in the blood, such as water, salts, etc., combined with others which have been elaborated by the glandular epithelium from more or less different substances in the blood. The secretion may be eliminated from the body as detrimental, as urine, or it may be used, as the digestive secretions, to serve requirements of the organism or (as the milk) those of its offspring. Secretions which are merely eliminated as detrimental are called *excretions*. The act of secreting seems, in most instances at least, to be a vital act of the glandular epithelium, and is often, if not always, under direct nervous control. (b) In vegetable

physiology, the process by which substances are separated from the sap of vegetables. The descending sap of plants is not merely subservient to nutrition, but furnishes various matters which are secreted or separated from its mass, and afterward elaborated by particular organs. These secretions are exceedingly numerous, and constitute the great bulk of the solid parts of plants. They have been divided into—(1) *general or nutritious secretions*, the component parts of which are gum, sugar, starch, lignin, albumen, and gluten; and (2) *special or non-assimilable secretions*, which may be arranged under the heads of acids, alkalis, neuter principles, resinous principles, coloring matters, milks, oils, resins, etc.

secretory¹ (sē-kre'tō-ri), *a.* [*< F. sécratoire = Sp. Pg. It. secretorio, secretory; as secret¹ + -ory.*] Of or pertaining to secretion; performing the office of secretion: as, *secretory* vessels.

sect¹ (sekt), *n.* [*< ME. secte (= D. sekte = MLG. secta, secte = MHG. secte, G. secte, sekte = Sw. Dan. sekt, < F. or L.), < OF. secte, F. secte = Pr. Sp. secta = Pg. secta, seita = It. setta, a sect in philosophy or religion, < LL. secta, a sect in philosophy or religion, a school, party, faction, class, gild, band, particularly a heretical doctrine or sect; in ML. in general a following, suite, a suit at law, a part, train, series, order, suit of clothes, etc.; < L. secta, a school or set of doctrines (in philosophy), in earliest use a mode of life, a way, most fre-*

quently in the phrase *sectam (alicujus) sequi* or *persequi*, 'follow (some one's) way' (whence *sectam (alicujus) secuti*, 'those following (some one's) way,' one's party, sect, or faction), where *secta* is prop. 'a way, road,' lit. 'a way cut through,' being orig. pp., *secta* (sc. *via*, way), fem. of *sectus*, pp. of *secare*, cut, as used in the phrase *secare viam*, take one's way, travel one's road, lit. 'cut one's way' (cf. Gr. *τεμνεν ὁδόν*, cut one's way, take one's way); see *secant*, *sect*², *section*. Cf. ML. *rupta*, a way, road, orig. a road broken through a forest: see *route*⁵, *route*¹, *rut*¹. The L. *secta* has been explained otherwise: (a) According to Skeat and others, lit. 'a follower' (= Gr. *ἐπίτης*, a follower), with formative -*ta*, < *sequi* (√*sequ*, sec- as in *secundus*, etc.) (= Gr. *ἐπίσθαι*), follow: see *sequent*. But *secta* is never used in the sense of 'follower,' and the phrase *sectam alicujus sequi* cannot be translated 'follow some one's follower.' (b) L. *secta*, lit. 'a following,' formed from *sequi* as above; but this is equally untenable. The notion of 'a following,' however, has long been present in the use of the word, as in the ML. senses: see above, and cf. *sectator*, *suit*, *suite*, ult. < L. *sequi*, follow. (c) The notion that L. *secta* is lit. 'a party cut off,' namely from the true, orthodox, or established church, and thus implies schism and heresy (cf. *sect*²), is entirely groundless. Cf. *sept*¹.] 1. A system or body of doctrines or opinions held by a number of persons and constituting the distinctive doctrines of a school, as propounded originally by the founder or founders of the school and (usually) developed or modified by later adherents; also and usually, the body of persons holding such doctrines or opinions; a school of philosophy or of philosophers: as, the *sect* of Epicurus; the *sect* of the Epicureans.

As of the *secte* of which that he was born
He kept his lay, to which that he was sworn.
Chaucer, *Squire's Tale*, I. 10.

The academicks were willing to admit the goods of fortune into their notion of felicity; but no *sects* of old philosophers did ever leave a room for greatness. Dryden.

When philosophers in after-times embraced our religion, they blended it often with the peculiar notions of those *sects* in which they had been educated, and by that means corrupted the purity and simplicity of the Christian doctrine. Bp. Atterbury, *Sermons*, I. iv.

2. A party or body of persons who unite in holding certain special doctrines or opinions concerning religion, which distinguish them from others holding the same general religious belief; a distinct part of the general body of persons claiming the same religious name or origin; especially, such a party of innovators, differing in their beliefs from those who support the older or orthodox views; a party or faction in a religious body; a separate ecclesiastical organization; an ecclesiastical denomination: as, the *sects* of the Jewish religion (which were not separately organized); the *sects* of the Christian church (usually separately organized); Mohammedan *sects*; Buddhist *sects*. The Latin word *secta*, from which the English word *sect* is derived, did not at first become limited in Christian usage to a specific meaning. It was used for 'way,' 'mode of life,' etc., but also for the Greek *αἵρεσις* (Latin *hæresis*, the original of the English word *heresy*), signifying 'a school of philosophy, opinion, or doctrine,' especially peculiar or erroneous doctrine. A familiar application was to the sect of Christians, as distinguished from Jews and pagans. In four of the nine passages in which *αἵρεσις* is found in the New Testament, the Vulgate has *hæresis*, in the other five *secta*. In Acts xxiv. 14 it has 'the way (*sectam*) which they call heresy (*hæresim*).' The use of *secta* in these passages led to the meaning of 'a separate or heretical body,' which is found in writers of the fourth century, and by desynonymization *secta* emphasized the organization and *hæresis* the doctrine. Afterward it came to be supposed that the word *secta* meant, etymologically, 'a party cut off'; hence the more or less opprobrious use of *sect* by many writers. It is often used, however, unopprobriously, in a sense substantially identical with the original sense, to signify 'a body of persons who agree in a particular set of doctrines.'

This newe *secte* of Lollardie. Gower, *Conf. Amant.*, ProL.
After the most straitest *sect* of our religion I lived a Pharisee. Acts xxvi. 5.

Slave to no *sect*, who takes no private road,

Joins heaven and earth, and mortal and divine.

We might say that the massacre of St. Bartholomew was intended to extirpate, not a religious *sect*, but a political party. Macaulay, *Hallam's Const. Hist.*

Shak., 2 Hen. IV., ii. 4. 41.

Specifically—**2.** A member or an adherent of a sect in religion; a *sectarian*: often used opprobriously by those who regard as mere sects all bodies of Christians outside of their own.

Sects may be in a true Church as well as in a false, when men follow the Doctrin too much for the Teachers sake, whom they think almost infallible; and this becomes, through Infirmitie, implicit Faith; and the name *Sectary* pertains to such a Disciple. *Milton, True Religion.*

—**4.** A representation of an object as it would appear if cut by any intersecting plane, showing the internal structure; a diagram or picture showing what would appear were a part cut off by a plane supposed to pass through an object, as a building, a machine, a biological structure, or a succession of strata. In mechanical drawing, a *longitudinal section* usually presents the object as cut through its center lengthwise and vertically, a *cross-section* or *transverse section* as cut crosswise and vertically, and a *horizontal section* as cut through its center horizontally. *Oblique sections* are made at various angles. Sections are of great importance in geology, as it is largely by their aid that the relations and positions of the various members of the different formations, both stratified and unstratified, are made intelligible. The geological structure of any region is best indicated by one or more cross-sections on which the groups of rocks are represented in the order in which they occur and with the proper dips, as well as the irregularities due to faults, crust-movements, and invasions by igneous masses, by which causes the stratigraphy of a region may be made so complicated and obscure as to be unintelligible without such assistance to its comprehension as is afforded by cross-sections.

5. A thin slice of an organic or inorganic substance cut off, as for microscopic examination.

—**6.** In *zool.*, a classificatory group of no fixed grade or taxonomic rank; a division, series, or group of animals: used, like *group*, differently by different authors. Sections, cohorts, phalanges, tribes, etc., are frequently introduced between the family and the order, or between the family and the genus; but it is commoner to speak of *sections* of a genus (i. e., subgenera). The sense corresponds to that of the word *coup* as much used by French zoologists. The sections of many English entomologists often correspond to families as they are understood in continental Europe and the United States.

7. In *bot.*, a group of species subordinate to a genus: nearly the same as *subgenus* (which see).

—**8.** In *fort.*, the outline of a cut made at any angle to the principal lines other than a right angle.—**9.** The sign §, used either (a) as a mark of reference to a foot-note, or (b), prefixed to consecutive numerals, to indicate divisions or subdivisions of a book.—**Abdominal section**, laparotomy.—**Angular sections**. See *angular*.—**Cesarean, conic, dominant section**. See the adjectives.—**Frontal section**. See *frontal plane*, under *frontal*.—**Frozen section**, a cutting of frozen parts, or that which is cut while frozen; especially, the surface of such cutting. A rock is *massive* when it has no structure indicating an aqueous origin; it is *sedimentary* when its appearance indicates that it is made up of the detritus of other rocks, eroded and carried away by watery currents, to be deposited in another place. All sedimentary rocks are made up of the fragments of the original crust of the earth, of eruptive materials which have come up through this crust from below, or of other sedimentary beds which, having been deposited, have again in their turn been subjected to erosion and redeposition. It is in sedimentary rocks that organic remains are found; in the original crust of the earth, or in volcanic materials, traces of life could not be expected to occur.—**Sedimentary cataract**, a soft cataract, in which the denser parts have subsided.

But it is not essential to the offense of *sedition* that it threaten the very existence of the state or its authority in its entire extent. Thus, there are seditious assemblies, seditious libels, etc., as well as direct and indirect threats and acts amounting to *sedition*—all of which are punishable as misdemeanors by fine and imprisonment.*

Sedum (sē'dum), *n.* [*NL. (Tournefort, 1700), < L. sedum, houseleek.*] *1.* A genus of petaloid plants, of the order *Crassulaceæ*. It is characterized by flowers with a four- or five-lobed calyx, the same number of separate petals, twice as many stamens alternately adnate to the petals, and a number of small scales inserted beneath the four or

five ovaries, the latter containing numerous ovules and ripening into separate follicles. There are about 150 species, natives of north temperate and frigid regions, rare in America, where one occurs in Peru, and in the United States 16 or more, chiefly in the mountains, with 3 others naturalized in the east. They are usually smooth herbs, either erect or decumbent, often tufted or moss-like, and remarkable for their fleshy stems and leaves. The latter are of very varied shapes, usually entire or but slightly toothed, and either opposite, alternate, or whorled. The flowers are borne in cymes, usually white, yellow, or pink, sometimes purplish or blue. Many species are common in dry, barren, or rocky places where little else will grow. The 10 British species and some of the American are known as *stonecrop*. Many others, known in cultivation by the generic name, and favorites for ornamenting rockwork, filling vases, and covering walls, are valued for the permanence of their foliage, which resists drought. Several with stiff rosettes of thick leaves are used for bedding out in summer, or employed for decorative borders and to form permanent designs, mottoes, and lettering. Many similar Mexican plants so used, and commonly confused with these, belong to the subgenus *Echeveria* of the related genus *Cotyledon*, and are distinguished by their united five-furrowed corolla-tube. A similar habit occurs in the related genus *Semperflorens*. Several other species are in cultivation for their pink, purple, or scarlet flowers, and others for their variegated leaves mottled with white or yellow. A few are dioecious, and have flat, thinner leaves, forming the subgenus *Rhodiola*, the *rhodia* of medieval shops. (See *rosaroot* and *heal-all*.) Many species are remarkable for persistence of life, cut stems growing and even flowering when fastened on a wall, deriving nourishment from reserves in their lower leaves and succulent stem, especially *S. Telephium* (for which see *orpine*, 2), also called *live-for-ever* and *living*, and known as *Aaron's-rod* because sometimes growing when pressed and apparently dried, and as *midsummer-men* because formerly used for divination on midsummer eve by setting up two stems to see if the one representing the lover will turn to the other. *S. acre*, the English wall-pepper, bird's-bread, creeping jack, or pricklet, an emetic and cathartic, is often cultivated in America as *moss, golden-moss, or love-entangle*, and *S. Sibboldii*, a Japanese species valued for its grayish-green whorled leaves, as *constancy*; *S. rupestre* is known in England as *jealousy*; and for *S. Anacampseros*, see *herb of friendship*, under *herb*. *S. album*, formerly esteemed in medicine and eaten cooked or as a salad, is known as *icorn-grass* and *pricknadam*. *S. pulchellum* of the southern United States is sometimes cultivated under the name of *scidoe's-crow*. *S. ternatum*, the wild stonecrop of rocky places in Pennsylvania and southward, with white flowers and rounded ornamental leaves in threes, is also often cultivated. *S. telephium*, from the Potomac southward, and the *rosaroot*, in the Rocky Mountains and arctic America, are conspicuous on account of their growth in multitudes on high ledges of dry mountain-cliffs.

2. [*l. c.*] A plant of the genus *Sedum*: extended by very early writers to the houseleek and other crassulaceous plants. Sometimes written *cedum*.

And beestes wicke away thus may me kepe.

To *behold* is to look at a thing for some time, to see plainly, or to see that which is interesting, remark-

able, or otherwise worth seeing. To *witness* is to see a thing done or happening: as, to *witness* a surgical operation; hence, legally, to *witness* a signature is to certify that one saw it made.

2. The seat of a bishop, whether an ordinary bishop, or a bishop of higher rank (metropolitan, etc., patriarch, pope); the local center of a diocese and of diocesan authority, or of a diocese and other subordinate dioceses; the city or locality from which ecclesiastical jurisdiction is exercised; hence, episcopal rank, authority, and jurisdiction as exercised from a permanent local center. The word *see*, from meaning any seat of dignity, came to apply specifically to the cathedra, or episcopal throne, situated in a cathedral, thence to the city which contained the cathedral and was the chief city of a bishop's diocese, and so in modern usage to the diocese itself. It differs from *diocese*, however, in that *diocese* represents the territorial province for the care of which the bishop is responsible (that is, where his duties lie), whereas *see* is the local seat of his authority, dignity, and episcopal privileges. Both words differ from *bishopric*, in that *bishopric* represents the bishop's office, whether actual or nominal. See *throne*.

It is a body within the pericarp or seed-vessel, containing an organized embryo, or nucleus, which, on being placed under favorable circumstances, develops into an individual similar to that from which it came. The reproductive bodies of the lower or flowerless plants (cryptogams) differ in their mode of germination and in other ways, and are not called true seeds, but *spores*. (See *spore*.) The seed-coats are those of the ovule—two, or rarely only one. The outer, answering to the primine, is the more firm and is not rarely crustaceous in texture, and takes the name of *testa* (also *spermodermis* and *episperm*). The inner, answering to the secundine, is called *tegmen* (sometimes *endopleura*); when present, it is always conformed to the nucleus, and is thin or soft and delicate in texture. The seed-stalk or podosperm, when there is one, is the pedicel or attachment of the seed to the placenta, and answers to the funiculus of the ovule. The chalazs, raphe, and hilum of the ovule retain the same names in the seed. The foramen of the ovule is called the *micropyle* in the seed. The terms which denote the position of the ovule, such as *orthotropous*, *anatropous*, *amphitropous*, etc., also apply equally to the resulting seed. The nucleus may consist of the embryo alone, or of the embryo and the albumen, which is the nourishing substance upon which the developing plant is to feed until it is capable of maintaining itself. See the various terms, and cuts under *anatropous*, *campylotropal*, *Cruciferae*, *ovary*, and *plumule*.

The ancients called the circular definition also by the name of diallelon, as in this case we declare the definitum and the definiens reciprocally by each other. In Heb. gram.: (a) A vowel-point consisting
of three dots placed under a consonant, thus

ally represented by dissyllables pointed with a
long tone-vowel in the first and a short *seghol*
(ē) in the second syllable. *Segholates* have a mono-
syllabic primitive form with one short vowel (ā, i, ū), be-
longing usually to the first radical. By giving the second
radical a short *seghol* as helping vowel, the form becomes
dissyllabic. The first syllable then becomes open, and, tak-
ing the tone, appears as long *e* (*seghol* or *taere*) or long *o*.

segm. An abbreviation for *segment*, used in bot-
anical writings. Gray.

segment (seg'ment), *n.* [= F. *segment* = Sp.

of the earth, a strip of tinsel, ML. in geom.
(tr. Gr. *τμήμα*) a segment, < *secare*, cut: see
secant, and cf. *section*, *sector*.] 1. A part cut
off or marked as separate from others; one of
the parts into which a body naturally divides
itself; a section: as, the *segments* of a calyx;
the *segments* of an orange; the *segments* of a
leaf. Specifically, in *zool.* and *anat.*: (a) One of the rings,
somites, or metameres of which the body of an animal
is theoretically or actually composed, as an arthromere of
a worm or crustacean, or a diarthromere of a vertebrate.
See cuts under *Callinorpha*, *cephalic*, *Podophthalmina*,
præstomium, and *promethus*. (b) One of the three pri-
mary divisions of either fore or hind limb of a vertebrate,
corresponding to the parts known in man as the upper

divisions of the skull: a cranial seg-

sidered a modified vertebra.

2. In *geom.*, a part cut off from

ment is the angle contained by two straight lines drawn
from any point in its arc to the extremities of its chord or
base.

segment (seg'ment), *v.* [*< segment, n.*] 1.
intrans. To divide or become divided or split
up into segments. (a) In *embryol.*, to undergo seg-
mentation, as an ovum or vitellus. See *segmentation*. (b)
In *physiol.*, to reproduce by semiffission or budding.

Before this occurs, however, the vegetal unit, if it does
not divide, may *segment* or bud; the bud grows into a unit
similar to its parent, and this in its turn may also *segment*
or bud. Bastian, The Brain as an Organ of Mind, i.

II. *trans.* To separate or divide into seg-
ments: as, a *segmented* cell.

segmenta, *n.* Plural of *segmentum*.

segmental (seg'men-tal), *a.* [*< segment + -al.*]

1. Having the form of the segment of a circle;

being a segment: as, a *segmental* arch.—

2. Of or pertaining to segments or segmenta-

tion: as, a *segmental* formula; *segmental* parts;

segmental organs.—3. Specifically, in *embryol.*,

noting the primitive and rudimentary renal or-

gans which occur in all vertebrates and some

invertebrates, consisting in the former of

branched tubules opening at one end into the

somatic cavity and at the other by one or more

main ducts into the cloaca or hindgut. These

segmental organs of a vertebrate are divisible into three

parts, anterior, middle, and posterior. The foremost is

the head-kidney or *promphron*, whose duct becomes a

Müllerian duct. The next is the Wolffian body proper, or

mesonephron, whose duct is the Wolffian duct. The last

or hindmost is the rudiment of the permanent kidney,

whose duct is the ureter; this is the *metanephron*. The

epithet *segmental* in this sense was originally used to

note the kind of renal or excretory organs which annelids,

as worms and leeches, possess, in more or fewer of the seg-

ments of the body, whence the name; it was subsequently

extended to the above-described embryonic renal organs

of vertebrates which are replaced by permanent kidneys—

these segmental organs being thus loosely synonymous

with *primitive kidney*, *Wolffian body*, and *protonephron*.

See cut under *leech*.

segmentally (seg'men-tal-i), *adv.* In a seg-
mental manner; in segments: as, the spinal
nerves are arranged *segmentally*.

These organs, being . . . *segmentally* arranged, are

termed *segmental* organs or *nephridia*.

Huxley and Martin, Elementary Biology, p. 244.

segmentary (seg'men-tā-ri), *a.* [*< segment + -ary¹*.] Segmental; pertaining to or indicating
segments: especially noting in entomology col-
ored bands, rings, or other marks on the abdo-
men, corresponding to successive segments, as
in many *Lepidoptera*.—**Segmentary geometry.** See
geometry.

segmentate (seg'men-tāt), *a.* [*< L. segmenta-
tus*, ornamented with strips of tinsel, lit. hav-
ing segments, < *segmentum*, a segment: see *seg-
ment*.] Having segments; segmented. *Encyc.*
Brit., II. 292.

segmentation (seg'men-tā'shon), *n.* [*< seg-
ment + -ation*.] The act of cutting into seg-
ments; a division into segments; the condi-
tion of being divided into segments; the man-
ner in which a segmented part is divided.—
Segmentation cavity. In *embryol.*, the central space in-
closed by the blastomeres of the embryo, before the
formation of a gastrula by invagination; the hollow of a blas-
tosome; a blastocoele.—**Segmentation nucleus**, the
nucleus of an impregnated ovum or germ-cell, resulting
from fusion of a male and a female pronucleus, and
capable of undergoing segmentation.—**Segmentation of
the vitellus**, in *embryol.*, yolk-cleavage; morulation; the
first process of germination of the ovum of any metazoic
animal, by which the original single cell of which the
ovum primitively consists becomes converted, wholly or
in part, into a mass of similar cells, constituting a morula
or mulberry-mass. The cells thus formed are specified as
cleavage-cells, *blastomeres*, or *segmentella*. Segmentation
goes on in different cases with some variations, chiefly
due to the presence of food-yolk and the position of this
yolk relatively to the formative yolk (see *centroblastical*,
ectocleithal). Total segmentation is necessarily restricted to
holoblastic ova; it is distinguished from the *partial* seg-
mentation of meroblastic ova (see *holoblastic*, *meroblastic*),
the terms meaning respectively that all, or that only some,
of the yolk segments. Total segmentation is *equal* or *regu-
lar* when the whole germ-cell divides into two similar
cleavage-cells, and these into four, and so on, the resulting
gastrula being the archigastrula. Total segmentation is
unequal or *irregular* when the cleavage-cells are unlike
one another; it results in the amphigastrula. The partial
segmentation of meroblastic eggs is always unequal, and
either *discoidal* with formation of a discogastrula, or
superficial and forming a perigastrula. Total equal segmen-
tation is also styled *primitive*, *primordial*, and *palinge-
netic*, the modifications introduced in unequal and partial
segmentation being described as *kenogenetic*. Other terms,
descriptive rather than definitive, are used by different

writers: the foregoing is nearly Haeckel's nomenclature.
See *egg¹*, *ovum*, *vitellus*, and cuts under *gastrula* and *gas-
trulation*.—**Segmentation rhythm**, the rate of produc-
tion of successive cleavage-cells, or their numerical ratio
of increase, whether 2, 4, 8, 16, 32, etc., or any other mode
of multiplication.—**Segmentation sphere**, a ball of
cleavage-cells; a blastosphere; a morula.

segmented (seg'men-ted), *a.* [*< segment + -ed²*.] Divided into segments, segmenta, or
segmentella; characterized by or exhibiting
segmentation; somitic; metameric: thus, the
body of a vertebrate is *segmented* according to
the number of vertebrae, whether any actual
division of parts may be evident or not.

segment-saw (seg'men-tā), *n.* 1. A circular
saw used for cutting veneers from squared logs,
consisting of a conical disk having the apex cen-
tral with the arbor, and very thin firmly toothed
segmental saw-plates fastened to the outer margin
of the disk. Such a saw having a diameter of 60
inches would be about 16 inches thick at the arbor—the

projectile for artillery, usually in the form of
a conical or oblong shell for rifled guns, in

bursting of the shell, or thrown forward, accord-
ing to the arrangement made: the whole is
cased in lead for transportation and loading.

1. A Spanish dance, usually of a lively character, for two dancers. Three varieties are distinguished, the manchega, the bolera, and the gitana, the first being the most vivacious, and the last the most stately. If government, however, throws the expense of coinage, as is reasonable, upon the holders, by making a charge to cover the expense (which is done by giving back rather less in coin than is received in bullion, and is called "levying a *seigniorage*"), the coin will rise to the extent of the *seigniorage* above the value of the bullion.

Seines vary in size from one small enough to take a few minnows to the shad-seine of a mile or more in length, hauled by a windlass worked by horses or oxen or by a steam-engine. The largest known seine was used for shad at Stony Point on the Potomac in 1871; it measured 3,400 yards, or nearly 2 miles; the lines and seine together had a linear extent of 5 miles, and swept 1,200 acres of river-bottom; this net was drawn twice in 24 hours.
