Coral reef, an accumulation of calcareous material which has been secreted from the water of the tropical ocean, and especially of the Pacific to the south of the equator, by the reef-building corals. Such accumulations, which are often of great dimensions, offer curious peculiarities of form and distribution. They have been classified under the names of *fringing* and *barrier reefs* and *atolls*. *Fringing reefs* border the land; *barrier reefs* extend parallel with but at some distance from the shore; *atolls* are approximately circular or elliptical in form, and typical atolls include a lagoon, which usually communicates with the ocean by one or more passages through the reef. Barrier reefs may be hundreds of miles in length; that off the shore of Australia is 1,250 miles long, and from 10 to 90 broad. Atolls vary from 1 to 50 miles and over in diameter. The principal mass of a coral reef consists essentially of dead coral, together with more or less of the skeletons and shells of other marine organisms; this dead material is mingled with debris resulting from the action of breakers and currents on the coralline formation. The exterior of such a reef, where conditions are favorable to the development of the coral animals, especially on its seaward face, is covered with a layer or mantle of living and growing coral, and the rapidity and vigor of this growth depend on the supply of food brought by the oceanic currents. Where the conditions for this supply have not been favorable, there the reefs are not found; where the conditions have been such as to encourage growth, but have ceased to have this character, there the formation of the reef has slackened or been stopped altogether. Investigations have shown that the reef-building corals cannot flourish where the temperature of the surface-water sinks below 70°; in the typical coral regions the temperature is decidedly higher than that, and its range very small. Neither can the reef-builders work at a considerable depth, or above the level of low tide; their entire vertical range is not more than 15 or 20 fathoms at the utmost. These conditions of coral-reef formation, coupled with the fact that the carbonate of lime in the form in which it has been left by the death of the organisms by which it was secreted is decidedly soluble in sea-water, are sufficient to account for all the peculiarities in the distribution and mode of occurrence of these remarkable structures. It is because the currents sweeping toward the eastern shores of the continents are warm and constant that, while the western sides of Africa and South America exhibit only isolated patches of coral, the eastern borders are abundantly supplied with it. It is not now considered necessary to call in the assistance of a general subsidence of the Pacific Ocean bottom in order to account for the form of the atolls; for it is the opinion of most of the recent investigators that all the characteristic features of the coral formations—whether these occur as fringing or barrier reefs, or as atolls—can be produced in regions of subsidence or of elevation, as well as in those where no change of level is taking place.

reef² (rēf), *n.* [Formerly *riff*; < ME. *rif*, < MD. *rif* (also *rift*), < D. *reef* = LG. *ref*, *rif* (> G. *reef*, *reff*) = Icel. *rif* = Sw. *ref* = Dan. *reb*, a reef of a sail; of uncertain origin; perhaps of like origin with *reef¹*. Hence *reef²*, *v.*, and *reef³*.] *Naut.*, a part of a sail rolled or folded up, in order to diminish the extent of canvas exposed to the wind. In topsails and courses, and sometimes in top-gallantsails, the reef is the part of the sail between the head and the first reef-band, or between any two reef-bands; in fore-and-aft sails reefs are taken on the foot. There are generally three or four reefs in topsails, and one or two in courses.

We take a reef, and to the rocking sleep.

In square sails the reef-points are tied round the yard as well as the sail; in fore-and-aft sails they may or may not be tied round the boom which extends the foot of the sail. In very large ships, where the yards are so large as to make it inconvenient to tie the reef-points around them, the sails are sometimes reefed to jacks on the yards.

Up, aloft, lads! Come, reef both topsails!
Davenant and Dryden, Tempest, I. 1.

2. To gather up stuff of any kind in a way similar to that described in def. 1. Compare *reefing*.—**Close reefed**, the condition of a sail when all its reefs have been taken in.—**To reef paddles**, in steamships, to disconnect the float-boards from the paddle-arms and bolt them again nearer the center of the wheel, in order to diminish the dip when the vessel is deep.—**To reef the bowsprit**, to rig in the bowsprit. The phrase usually has

application to yachts; men-of-war are said to *rig* in their bowsprits.

The *bowsprits* on cutters can be reefed by being drawn closer in and fiddled. *Yachtman's Guide*.

2. In *metal.*, to bring into a condition of purity as complete as the nature of the ore treated will allow. Used chiefly with reference to gold and silver, especially with reference to the separation (parting) of these two metals from each other and from the baser metals with which they are combined in what are known as bullion-bars or bricks of mixed metals, as they come from the mills located at or near the mines. Refining is, in general, the last stage or stages in the metallurgical treatment of an ore. As the term *refining* is commonly used with reference to the manufacture of iron, it means the partial decarburization and purification of pig in the open-hearth furnace, for the purpose of rendering it more suitable for use in the puddling-furnace in which the process of converting it into malleable iron is completed. This method of puddling is called *dry puddling*. The operation of converting pig-into wrought-iron in the open-hearth furnace, when begun and completed without puddling, is generally called *fining*, and in this process charcoal or coke is used. There are many modifications of the fining process, but the principle is the same in all. In puddling, raw coal is used, and the fuel does not come in contact with the metal: in fining, the ore and fuel (either charcoal or coke) are together upon the same hearth. The

various fining processes for converting pig-into wrought-iron, with charcoal as fuel, were of great importance before the invention of puddling, by which method much the larger part of the wrought-iron now used in the world is prepared, and this is done, for the most part, without previous partial decarburization of the pig in the refinery, by the process known as *wet puddling*, or *pig-boiling*. See *puddle*† and *finery*†.

2. The act of reflecting, or the state of being reflected; specifically, in *physics*, the change of direction which a ray of light, radiant heat, or sound experiences when it strikes upon a surface and is thrown back into the same medium from which it approached. Reflection follows two laws, viz.—(1) the angle of reflection is equal to the angle of incidence; and (2) the reflected and incident rays are in the same plane with a normal to the surface. If DE represents the surface of a mirror and CB the incident ray, then HBC is the angle of incidence, and HBA, equal to it, is the angle of reflection. This applies alike to sound, to radiant energy (heat and light), and also to a perfectly elastic body bounding from a perfectly elastic rigid surface. The plane passing through the perpendicular to the reflecting surface at the point of incidence and the path of the reflected ray of light or heat is called the *plane of reflection*. (See *mirror*, *echo*.) For the total reflection of rays when the critical angle is passed, see *refraction*.

"I am sorry, but I must do it; I am driven to it: every body has to do it; we must look at things as they are; these are the reflections which lead men into violations of morality."
J. R. Seeley, Nat. Religion, p. 57.

7. A kind of self-consciousness resulting from an outward perception, whether directly or indirectly; the exercise of the internal sense; the perception of a modification of consciousness; the faculty of distinguishing between a datum of sense and a product of reason; the consideration of the limitations of knowledge, ignorance, and error, and of other unsatisfactory states as leading to knowledge of self; the discrimination between the subjective and objective aspects of feelings. The Latin word *reflectio* was first used as a term of psychology by Thomas Aquinas, who seems to intend no optical metaphor, but to conceive that consciousness is turned back upon itself by the reaction of the object of outward perception. According to Aquinas, pure thought in itself can know nothing of singulars, or particular things; but in perception there is a peculiar sense of reaction or reciprocity which he calls *reflection*, and this first makes us aware of the existence of actual singulars and also of thought as being an action; and this, according to him, is the first self-consciousness. Scotus accepted reflection, not as affording the first knowledge of singulars, but as a perception of what passes in the mind, and thus the original meaning of the term was modified. Walter Burleigh, who died in 1337, affords an illustration of this when he says that the thing without is apprehended before the passion which is in the soul, because the thing without is apprehended directly, and the passion of the soul only indirectly, by reflection. Ramus, in his dissertation on reflection, defines it as "the successive direction of the attention to several partial perceptions." A still further change of meaning had come about when Goclenius, in 1613, defined reflection as "the inward action of the soul, by which it recognizes both itself and its acts and ideas." The importance of the word in the English school of philosophy (Berkeley, Hume, etc.) may be said to be due entirely to its use by Locke, who explains it as follows:

The other fountain from which experience furnisheth the understanding with ideas is the perception of the operations of our own mind within us, as it is employed about the ideas it has got; which operations, when the soul comes to reflect on and consider, do furnish the understanding with another set of ideas, which could not be had from things without; and such are perception, thinking, doubting, believing, reasoning, knowing, willing, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do from these receive into our understandings as distinct ideas as we do from bodies affecting our senses. This source of ideas every man has wholly in himself; and though it be not sense, as having nothing to do with external objects, yet it is very like it, and might properly enough be called internal sense. But as I call the other sensation, so I call this *reflection*, the ideas it affords being such only as the mind gets by reflecting on its own operations within itself. By *reflection*, then, in the following part of this discourse, I would be understood to mean that notice which the mind takes of its own operations, and the manner of them; by reason whereof there come to be ideas of these operations in the understanding.

Locke, Human Understanding, II. l. 4.
Reid endeavored to revive the Ramist use of the word, for which he is condemned by Hamilton. Kant, in his use of the term, returns to something like the Thomist view, for he makes it a mode of consciousness by which we are made aware whether knowledge is sensuous or not. Kant makes use of the term *reflection* to denote a mode of consciousness in which we distinguish between the relations of concepts and the corresponding relations of the objects of the concepts. Thus, two concepts may be different, and yet it may be conceived that their objects are identical; or two concepts may be identical, and yet it may be conceived that their objects (say, two drops of water) are different. Mr. Shadworth Hodgson, in his "Philoso-

phy of Reflection," 1873, uses the term to denote one of three fundamental modes of consciousness, namely that in which the objective and subjective aspects of what is present are discriminated without being separated as person and thing.

The faculty by which I place the comparison of representations in general by the side of the faculty to which they belong, and by which I determine whether they are compared with each other as belonging to the pure understanding or to sensuous intuition, I call transcendental reflection.

Kant, Critique of Pure Reason, tr. by Müller, p. 261.

The particular reflection that states of consciousness are things, or that the Subject is its Objects, constitutes . . . the reflective mode of consciousness. . . . Perception . . . is the rudimentary function in reflection as well as in primary consciousness; and reflective conception is a derivative from it. *S. Hodgson, Philosophy of Reflection, l. 2, § 3.*

3. That which reflects. Specifically—(a) A polished surface of metal or any other suitable material, used for the purpose of reflecting rays of light, heat, or sound in any required direction. Reflectors may be either plane or curvilinear; of the former the common mirror is a familiar example. Curvilinear reflectors admit of a great variety of forms, according to the purposes for which they are employed: they may be either convex or concave, spherical, elliptical, parabolic, or hyperbolic, etc. The parabolic form is perhaps the most generally serviceable, being used for many purposes of illumination as well as for various highly important philosophical instruments. Its property is to reflect, in parallel lines, all rays diverging from the focus of the parabola, and conversely. A series of parabolic mirrors, by which the rays from one or more lamps were reflected in a parallel beam, so as to render the light visible at a great distance, was the arrangement generally employed in lighthouses previous to the invention of the Fresnel lamp, or dioptric light. The annexed cut is a section of a ship's lantern fitted with an Argand lamp and parabolic reflector.

Revolution means merely transformation, and is accomplished when an entirely new principle is—either with force or without it—put in the place of an existing state of things. *Reform*, on the other hand, is when the principle of the existing state of things is continued, and only developed to more logical or just consequences. Ballot reform, reform in the manner of voting in popular elections. Civil-service reform, in *U. S. politics*, reform in the administration of the civil service of the United States; more generally, reform in the administration of the entire public service, federal, State, and local. Since the passage of the Civil-service Act in 1871 this reform has been one of the leading questions for public discussion. See *Civil-service Act* (under *civil*) and *spoils system* (under *spoil*). — **Reform Act**. See *Reform Bill*. — **Reform Bill**, specifically, in *Eng. hist.*, a bill for the purpose of enlarging the number of voters in elections for members of the House of Commons, and of removing inequalities in representation. The first of these bills, passed in 1832 by the Liberals after a violent struggle, and often called specifically *The Reform Bill*, disfranchised many rotten boroughs, gave increased representation to the large towns, and enlarged the number of the holders of county and borough franchise. The effect of the second Reform Bill, passed by the Conservatives in 1867, was in the direction of a more democratic representation, and the same tendency was further shown in the Franchise Bill (see *franchise*) passed by the Liberals in 1884. — **Reform school**, a reformatory. Specifically, with the definite article—3. [*cap.*] The great religious revolution in the sixteenth century, which led to the establishment of the Protestant churches. The Reformation assumed different aspects and resulted in alterations of discipline or doctrine more or less fundamental in different countries and in different stages of its progress. Various reformers of great influence, as Wyclif and Hus, had appeared before the sixteenth century, but the Reformation proper began nearly simultaneously in Germany under the lead of Luther and in Switzerland under the lead of Zwingli. The chief points urged by the Reformers were the need of justification by faith, the use and authority of the Scriptures and the right of private judgment in their interpretation, and the abandonment of the doctrine of transubstantiation, the adoration of the Virgin Mary and saints, the supremacy of the Pope, and various other doctrines and rites regarded by the Reformers as unscriptural. In the German Reformation the leading features were the publication at Wittenberg of Luther's ninety-five theses against indulgences in 1517, the excommunication of Luther in 1520, his testimony before the Diet of Worms in 1521, the spread of the principles in many of the German states, as Hesse, Saxony, and Brandenburg, and the opposition to them by the emperor, the Diet and Confession of Augsburg in 1530, and the prolonged struggle between the Protestants and the Catholics, ending with comparative religious equality in the Peace of Passau in 1552. The Reformation spread in Switzerland under Zwingli and Calvin, in France, Hungary, Bohemia, the Scandinavian countries, Low Countries, etc. In Scotland it was introduced by Knox about 1560. In England it led in the reign of Henry VIII. to the abolition of the papal supremacy and the liberation from papal control of the Church of England, which, after a short Roman Catholic reaction under Mary, was firmly established under Elizabeth. In many countries the Reformation occasioned an increased strength and zeal in the Roman Catholic Church sometimes called the *Counter-Reformation*. The term *Reformation* as applied to this movement is not of course accepted by Roman Catholics, who use it only with some word of qualification.

Prophecies and Forewarnings . . . sent before of God, by divers and sundry good men, long before the time of Luther, which foretold and prophesied of this *Reformation* of the Church to come.

Pope, *Martyrs* (ed. 1684), II. 43.

See *calendar*.—**Syn. 2.** *Amendment, Reform, Reformation.* *Amendment* may be of any degree, however small; *reform* applies to something more thorough, and *reformation* to that which is most important, thorough, and lasting of all. Hence, when we speak of temperance *reform*, we dignify it less than when we call it temperance *reformation*. Moral *reform*, religious *reformation*; temporary *amendment* or *reform*, permanent *reformation*. *Reform* represents the state more often than *reformation*.

Reformatories, or reformatory schools, are, in Great Britain, identical in character with certified industrial schools, admission to either being determined by differences of age and criminality, and they differ from ragged schools in so far as they are supported by the state, and receive only such children or youths as are under judicial sentence.

2t. Deprived of rank or position, or reduced in pay. See *reformato*, 2.—**Captain reformed**. See *captain*.—**Reformed Bernardines**. See *Reform*, 1.—**Reformed Church**. (*a*) A general name for the Protestant bodies on the continent of Europe which trace their origin to the Swiss reformation under Zwingli and Calvin, as distinguished from the Lutheran Church. In France the Reformed were known as Huguenots. In the Netherlands the Arminians afterward separated from the Calvinists (Gomarists). In Germany, after 1817, the greater part of the Reformed and Lutherans combined to form the United Evangelical Church. Specifically—(*b*) In the United States: (1) The Reformed (Dutch) Church in America, growing out of a union among the Dutch churches in America in 1770 and finally perfected in 1812. The territory of the denomination was at first limited to the States of New York and New Jersey and a small part of Pennsylvania, but was gradually extended to the West. The affairs of each congregation are managed by a consistory, consisting of elders and deacons chosen for two years. The elders, with the pastor, receive and dismiss members and exercise discipline; the deacons have charge of the alms. Both together are ex officio trustees of the church, hold its property, and call its minister. Ex elders and ex deacons constitute what is called the Great Consistory, which may be summoned to give advice in important matters. The minister and one elder from each congregation in a certain district constitute a classis, which supervises spiritual concerns in that district. Four ministers and four elders from each classis in a larger district make a Particular Synod, with similar powers. Representatives, clerical and lay, from each classis, proportioned in number to the size of the classis, constitute the General Synod, which has supervision of the whole, and is a court of last resort in judicial cases. The church is Calvinistic in its theological belief, and possesses a liturgy the greater part of which is optional except the offices for the sacraments, for ordination, and for church discipline. (2) The Reformed (German) Church in the United States. This church was constituted by colonies from Germany in New York, Maryland, Virginia, and North and South Carolina. The first synod was organized September 27th, 1747, under the care of the Reformed Classis of Amsterdam. The church holds to the parity of the ministry, maintains a presbyterial form of government, is moderately Calvinistic in its theology, and provides liturgical forms of service, which are, however, chiefly optional. (3) The True Reformed Dutch Church, the result of a secession from the Reformed Dutch Church in America in 1822. (4) The Reformed Episcopal Church, an Episcopal church organized in the United States in 1873, by eight clergymen and twenty laymen previously members of the Protestant Episcopal Church. It maintains the episcopacy as a desirable form of church polity, but not as of divine obligation, continues to use the Book of Common Prayer, but in a revised form, and rejects the doctrines of apostolic succession, the priesthood of the clergy, the sacrifice or oblation in the Lord's Supper, the real presence, and baptismal regeneration.—**Reformed officer**, in the British army, one who is continued on full pay or half-pay after his troops are broken up. *Farrow*, *Mil. Encey.*—**Reformed Presbyterian Church**, a Presbyterian denomination originating in Scotland. See *Cameronian*, *n.*, 1, and *Covenanter*, 2.—**Reformed procedure**. refraction (rē-frak'shōn), *n.* [*< OF. refraction*, F. *réfraction* = Sp. *refracción* = Pg. *refracção* = It. *rifrazione*, *refrazione*, < ML. *refractio* (-n), lit. a breaking up (in logic tr. Gr. *anástasis*), NL. *refraction*, < L. *refringere*, pp. *refractus*, break up, break open, break to pieces: see *refract*.] *1.* The act of refracting, or the state of being refracted; almost exclusively restricted to physics, and applied to a deflection or change of direction of rays, as of light, heat, or sound, which are obliquely incident upon and pass through a smooth surface bounding two media not homogeneous, as air and water, or of rays which traverse a

medium the density of which is not uniform, as the atmosphere. It is found (1) that, when passing into a denser isotropic medium, the ray is refracted toward the perpendicular to the surface, and bent away from it when passing into one less dense; (2) that the sines of the angles of incidence and refraction bear a constant ratio to each other for any two given media; and (3) that the incident ray and the refracted ray are in the same plane. Thus,

Fig. 1.

at all, but suffers total reflection at P. In fig. 2, AHC is the angle of incidence, and EHK the angle of refraction, CD being the normal to the surface; if, further, the second surface is parallel to the first, the ray emerging into the original medium at E has a direction EF parallel with its first direction, AH.

Fig. 2.

If (fig. 3) the refracting medium has the form of a prism (ABC), the incident ray LF suffers a double change of direction, first (FE) in passing into the prism, and second (EG) in emerging from it; the total angle of deviation IDL varies in value with a change in the direction of LF, but has a definite minimum value when the angles of incidence and emergence are equal. If *d* represents the angle of the prism BAC, and *r* the angle of minimum deviation, IDL, then the refractive index *n* of the material of which the prism is made is given by the relation $n = \frac{\sin \frac{1}{2}(d+r)}{\sin \frac{1}{2}d}$. The angle of deviation or refraction also increases as the wave-length of the ray diminishes, and hence a beam of white light in passing through a prism is both refracted and dispersed, thus yielding a spectrum. The phenomena of the refraction of light explain the properties of lenses (see *lens*) and of prisms (see *prism* and *spectrum*). Sound-waves may also be refracted when passing from one medium to another of different density, obeying the same laws as light. *Double refraction* is the separation of a ray of light into two rays, which are unequally refracted upon passing through an anisotropic medium. This property belongs to all transparent crystalline substances except those of the isometric system. A striking example is calcite, hence called *doubly refracting spar*. In uniaxial crystals (those belonging to the tetragonal and hexagonal systems) one of the rays follows the ordinary law of refraction (see law (2), above), and is called the *ordinary ray*; the other, which does not, is called the *extraordinary ray*; both rays are polarized (see *polarization*), the ordinary ray having vibrations perpendicular to and the extraordinary ray vibrations parallel to the vertical axis. If the index of refraction is greater for the ordinary ray than for the extraordinary ray, the crystal is said to be *negative*, and in the opposite case *positive*: otherwise expressed, a crystal is negative or positive according as the crystallographic axis (optical axis) is the axis of greatest or of least elasticity. In the direction of the vertical axis a ray suffers no double refraction, and this direction is called the *optic axis*. In biaxial crystals (those belonging to the orthorhombic, monoclinic, and triclinic systems) neither ray follows the ordinary law of refraction, and there are two directions, called *optic axes*, lying in the plane of the axes of greatest and least elasticity, in which a ray suffers no double refraction. There are also three indices of refraction, corresponding to the rays propagated by vibrations parallel to the three axes of elasticity. A biaxial crystal is called *negative* or *positive* according as the acute bisectrix coincides with the axis of greatest or of least elasticity. According to the degree of difference between the two indices of refraction of a uniaxial crystal and between the greatest and least of the three indices of a biaxial crystal, the double refraction is said to be *strong* or *weak*; upon this difference depends the brilliancy of color of thin sections of a crystal as seen in polarized light. Amorphous substances like glass do not show double refraction, except under abnormal conditions, as when subjected to unequal strains, as in glass suddenly cooled. This is also true of crystals belonging to the isometric system, which, however, sometimes show secondary or abnormal double refraction (as garnet), due to internal molecular strain or other cause. For the refraction of the eye, see *eye*, and *crystalline humor* (under *crystalline*). Errors of refraction in the eye are tested by trial with lenses, test types, etc., by the ophthalmoscope, or by skiascopy or the shadow-test, and are corrected by appropriate glasses.

refrigerating-chamber (rē-frij'e-rā-ting-cham'bēr), *n.* A chamber in which the air is artificially cooled, used especially for the storage of perishable provisions during warm weather.

refrigerating-machine (rē-frij'e-rā-ting-mash'ēn), *n.* A machine for the artificial production of cold. In such machines mechanical power is employed for the conversion of heat into work by operating upon a gas at a temperature far removed from that at which such gas becomes a liquid. They perform the following cycle of operations: first, the gas is compressed into a smaller volume, in which compression its contained heat is increased by the heat-equivalent of the work performed in the compression; secondly, the compressed gas is cooled under constant pressure, and thus brought near to the temperature of the cooling medium (usually water), and the increase of heat due to compression is removed; thirdly, the compressed and cooled gas is permitted to expand, expending a portion of its expansive force in the performance of work. This work having been performed at the expense of the store of heat originally contained in the gas, the latter has now lost the heat-equivalent of the work, and its temperature is greatly lowered. The now cold gas can be used for the refrigeration of any other substance which has a higher temperature by methods described under *ice-machine* and *refrigeration*. In other machines a gas or vapor the ordinary temperature of which is near to that at which it liquefies is compressed and cooled, and subsequently permitted to assume the gaseous form. By the compression the temperature of liquefaction is raised till it becomes the same as or a little higher than that of a conveniently available cooling medium, such as ordinary atmospheric air, or, most commonly, water at ordinary temperature, the application of which to cooling the gas still under constant pressure reduces it to the liquid state, or to a state of intermixed liquid and gas. The subsequent expansion of the liquid into gas is performed at the expense of its inner heat. It therefore suffers a reduction of temperature, to restore which it absorbs its latent heat of vaporization from a surrounding or contiguous substance (usually a saline solution), which, thus made cold, is used for cooling air-spaces, or refrigerators or substances therein contained, or for making ice. Machines of either of the above classes are very commonly called *ice-machines*, and are so styled in the classifications of inventions in both the United States and British patent-offices, whether designed for the manufacture of ice, for merely cooling substances in insulated spaces or refrigerators, or for both these purposes.

refrigeration (rē-frij'e-rā'shon), *n.* [*< OF. refrigeration, F. réfrigération = Sp. refrigeración = Pg. refrigeração = It. refrigerazione, < L. refrigeratio(n)-, a cooling, coolness, mitigation (of diseases), < refrigerare, pp. refrigeratus, make cool again: see refrigerate.*] **1.** The act of refrigerating or cooling; the abatement of heat; the state of being cooled.

America, ed. Arber, p. 204).

The testimony of geological evidence . . . indicates a general *refrigeration* of climate.

Croll, Climate and Time, p. 530.

Specifically—**2.** The operation of cooling various substances by artificial processes. This is effected by the use of inclosures in which the articles to be cooled are placed on or in proximity to ice or other refrigerating substances or freezing-mixtures, or in air cooled by a refrigerating-machine or apparatus; or, as in beer-cooling, by floating metallic pans or vessels containing ice upon the surface of the liquid to be cooled, or by circulating the latter over an extended surface of some good conductor of heat cooled by continuous contact of cold water, cold air, or cold brine with the opposite surface. See *ice-machine* and *refrigerating-machine*.—**Chemical refrigeration**, refrigeration by the use of mixtures of substances which, during their admixture, by mutual solution of each in the other, or the solution of one or more in another or others, become lowered in temperature by absorption of the latent heat of liquefaction from the sensible heat. Remarkable changes of temperature are thus produced by a variety of refrigerating mixtures or freezing-mixtures. See *freezing-mixture*.—**Mechanical refrigeration**. (a) In its strictest sense, the conversion of heat into work by the expansion of a volume of gas or vapor which performs work during the act of expansion, as in moving a piston against some resistance, usually that of a pump or compressor for compressing another volume of such gas or vapor. The gas during the expansion, if it expands adiabatically, is reduced in temperature by the conversion of its inner heat into work, the reduction being found in degrees by dividing the work due to the expansion by the product of the specific heat of the gas, the weight of the volume expanded, and the mechanical equivalent of heat. Air mechanically refrigerated is frequently discharged directly into refrigerators or rooms it is desired to cool, but in apparatus for cooling by the use of other gases and vapors a strong solution of some salt which resists freezing at low temperatures—as sodium, calcium, or magnesium chloride—is used as a medium for extracting heat from the substances and spaces to be cooled, and as a vehicle for conveying the heat so abstracted to the mechanically cooled gas. See *ice-machine*. (b) In a broader sense, a process of refrigeration in which the cycle of heat-changes is only partly produced by mechanical action, as in compression ice-machines using anhydrous ammonia, wherein the cooling of the vapor takes place entirely during the formation from the liquid, and is caused by absorption of the latent heat of vaporization from the sensible heat of the substance, the mechanical part of the process being wholly confined to compressing the ammonia-vapor while liquefying it under the action of cold and pressure. Such machines are the most effective and the most extensively used.

refrigerative (rē-frij'e-rā-tiv), *a.* and *n.* [= OF. *refrigerativus*, F. *réfrigératif* = Sp. Pg. *refrigerativo* = It. *refrigerativo*, *refrigerativo*; as *refrigerate* + *-ive*.] *I. a.* Cooling; refrigerant; as, a *refrigerative* treatment.

refrigerator (rē-frij'e-rā-tor), *n.* [*< refrigerate* + *-or*.] That which refrigerates, cools, or keeps cool; specifically, any vessel, chamber, or apparatus designed to keep its contents at a temperature little if at all above the freezing-point.

In a restricted sense, a refrigerator is an inclosed chamber or compartment where meats, fish, fruit, or liquors, etc., are kept cool by the presence of ice or freezing-mixtures, or by the circulation of currents of cold air or liquid supplied by an ice-machine or a refrigerating-machine. Domestic refrigerators are made in a great variety of shapes, and may be either portable or built into the walls of a house. They range from the common ice-box (which in its simplest form is merely a metal-lined wooden box with facilities for drainage, kept partly filled with ice on which fish or meat may be kept) to large and elaborate ice-chests and ice-rooms. Small refrigerators are sometimes called *ice-refrigerators*.—*Anesthetic refrigerator*. See *anesthetic*.

The act of regenerating or producing anew.—2. In *theol.*: (a) A radical change in the spirit of an individual, accomplished by the di-

rect action of the Spirit of God. Evangelical theologians agree that there is a necessity for such a radical spiritual change in man in order to the divine life; but they differ widely in their psychological explanations of the change. They are, however, generally agreed that it consists of or at least necessarily involves a change in the affections and desires of the soul. Regeneration is also understood, as by the Roman Catholic Church, to be the gift of the germ of a spiritual life conferred regularly by God's ordinance in baptism, which is accordingly called the *sacrament of regeneration*, or simply *regeneration*. The word *regeneration* occurs only once in the New Testament in its ordinary theological meaning; but equivalent expressions are found, such as "begotten again," "born again," "born of God," "born of water and of the Spirit."

According to his mercy he saved us, by the washing of *regeneration*, and renewing of the Holy Ghost. *Tit. iii. 5.*

3 (rē-jen'e-rā'shon). In *biol.*, the genesis or origination of new tissue to repair the waste of the body, or to replace worn-out tissue; also, the reproduction of lost or destroyed parts or organs. Regeneration of tissue constantly goes on in all animals in the ordinary repair of waste products of vital action; but the replacing of lost parts, as a limb, is nearly confined to animals below vertebrates, in many of which it is an easy or usual process.—**Baptismal regeneration**. See *baptismal*.—*Syn. 2. See conversion*.—*3. See reproduction*.

2. In *metal.*, a chamber filled with a checker-work of fire-bricks; that part of a regenerative furnace in which the waste heat of the gases escaping from the hearth is, by reversal of the draft at suitable intervals, alternately stored up and given out to the gas and air entering the furnace. The idea of employing what is now generally called the "regenerative system" of heating was first conceived by Robert Stirling, in 1816, but his arrangement for carrying it out was not a practical one. The present form of the furnace, and in general the successful application of the principle, constituting a highly important improvement in the consumption of fuel, are due to the brothers Siemens. The regenerative system has already been extensively applied in various metallurgical and manufacturing processes, and is likely to receive still further development. According to the Siemens regenerative method, there must be at least one pair of regenerative chambers, in order that the heat may be in process of being stored up in one while being utilized in the other. In the Siemens regenerative reheating- or mill-furnace there are two pairs of chambers, each pair consisting of one larger and one smaller chamber, through one of which the air passes, and through the other the gas on its way to the furnace. The so-called "Ponsard recuperator" is a form of regenerator in which, by an ingenious arrangement of solid and hollow fire-bricks, the current is made continuous in one direction, instead of requiring reversal as in the Siemens regenerative furnace. This form of furnace has been employed for reheating in rolling-mills.

3. In the old universities, a master or doctor who takes part in the regular duties of instruction or government. At Cambridge all resident masters of arts of less than four years' standing, and all doctors of less than two, are regents. At Oxford the period of regency is shorter. At both universities those of a more advanced standing, who keep their names on the college books, are called *non-regents*. At Cambridge the regents compose the upper house and the non-regents the lower house of the senate, or governing body. At Oxford the regents compose the congregation, which confers degrees and does the ordinary business of the university. The regents and non-regents collectively compose the convocation, which is the governing body in the last resort.

Only *regents*—that is, masters actually engaged in teaching—had any right to be present or to vote in congregations [at Bologna]. *Encyc. Brit.*, XXIII. 835.

4. *Milit.*, a body of soldiers, consisting of one or more battalions of infantry, or of several squadrons of cavalry, commanded by a colonel, or of a certain division of artillery. It is the largest permanent association of soldiers, and the third subdivision of an army-corps, several regiments constituting a brigade, and several brigades a division. These combinations are, however, temporary, while in the regiment the same officers serve continuously, and in command of the same bodies of men. The strength of a regiment may vary greatly, as any regiment may comprise any number of battalions. The organization of the British Royal Artillery is anomalous, the whole body forming one regiment. In 1880 it comprised nearly 35,000 officers and men, distributed in 30 brigades, each of which is as large as an ordinary regiment. In the United States service the full strength of cavalry regiments is about 1,200 each; of artillery, about 600; of infantry, 500; but these numbers are subject to inevitable variations. Especially—(a) A realm; one of several primary divisions of the earth's surface, characterized by its fauna: as, the Palearctic or the Nearctic *region*. The term acquired specific application to certain large principal areas from its use in this sense by P. L. Sclater in 1857. Sclater's regions, adopted with little modification by Günther and Wallace, were six in number: the Palearctic, Ethiopian, Oriental or Indian, Australian, Nearctic, and Neotropical. (See these words.) Baird added a seventh, the West Indian, now considered a division of the Neotropical. In 1874 Sclater, following Huxley, recognized as primary divisions (1) *Arctogaea*, comprising the Palearctic, Ethiopian, Indian, and Nearctic regions; (2) *Dendrogea*, represented by the Neotropical region; and (3) *Antarctogaea*, with a New Zealand region. (b) A secondary faunal area, the primary being called a *realm*: as, the Antillean, Central American, and Brazilian *regions* of the American Tropical realm. In this sense it has been used by most American zoologists. Various other divisions have been proposed, as by A. Murray in 1866, Huxley in 1868, W. T. Blanford in 1869, E. Blyth in 1871, A. Newton in 1875, T. Gill in 1878, and J. A. Allen in 1878. Each of the main divisions, however defined by different naturalists, is subdivided into several subregions or provinces, more or less minutely in different systems. Thus, for example, the Ethiopian region is divided by Newton into the Libyan, Guinean, Caffrarian, Mozambican, and Madagascarian subregions, and the Libyan subregion itself into the Arabian, Egyptian, Abyssinian, and Gambian provinces. The waters of the globe have been either included in the prime divisions based on the land faunas, or segregated in peculiar ones.—**Abdominal regions.** See *abdominal*.—**Agrarian region, anal region.** See the adjectives.—**Axillary region,** a region on the side of the thorax, extending from the axilla to a line drawn from the lower border of the mammary to that of the scapular region.—**Basilar region,** the region of the base of the skull.—**Bluegrass region.** See *grass*.—**Broca's region.** Same as *Broca's convolution*. The vocal registers are distinguished by quality more than by pitch, since the same tone can often be produced in more than one register. The difference lies in the way in which the larynx is used, but the exact nature of the process is disputed. The so-called *head-register* and *chest-register* include tones that call the cavities of the head and chest respectively into decided sympathetic vibration. The different vocal qualities are also called the *low*, *middle*, and *high registers*, or the *thick*, *middle*, and *thin registers*, depending in the first case upon the pitch of the tones for which they are best suited, and in the second upon the supposed condition of the vocal cords in producing them, or the quality of the tones produced.

regulator (reg'ū-lā-tor), *n.* [= F. *régulateur* = Sp. Pg. *regulador* = It. *regolatore*, *< ML. regulator*, a regulator, ruler, *< regulare*, regulate: see *regulate*.] 1. One who or that which regulates. Members of the unauthorized associations which have at various times been formed in parts of the United States for the carrying out of a rough substitute for justice in the case of heinous or notorious crimes have been called *regulators*.

2. A mechanical contrivance intended to produce uniformity of motion, temperature, power, etc. (*a*) In *engin.* and *mach.*: (1) A governor in the sense described and illustrated under *governor*, 6. (2) A governor employed to control the closing of the port-opening for admission of steam to the cylinder of an automatically variable cut-off steam-engine. This is a numerous class of regulators, in which the ball-governor described under *governor*, 6, is used to control the motion of the induction-valve instead of that of the throttle-valve. By leaving the throttle-valve fully open and closing the induction-valve earlier or later in the stroke, the steam arrives in the cylinder nearly at full pressure, and with its full store of available heat for conversion into work by expansion. (3) An arrangement of weights, springs, and an eccentric or eccentrics, carried on the fly-wheel shaft or on the fly-wheel of a steam-engine, connected with the stem of the induction-valve by an eccentric-rod, and automatically varying

a, fly-wheel shaft; *a*, *b*, and *a'*, eccentrics in different positions of the eccentrics *c* and *d*. The eccentric *c* turns freely on the shaft *a*, and is actuated by links *b*, that are pivoted to ears formed on the eccentric, and are also pivoted to weights *f*. The weights have the form of curved bars, and are pivoted at one end to spokes of the wheel, as shown at *g*. The eccentric *d* is fitted to and turns freely upon the periphery of the eccentric *c*. It is also connected by a link *h* to the toe of one of the weights, and is rotated on *c* by the motion of the weight toward or away from the center of the shaft *a*. The eccentric *e* is also rotated on the shaft *a* by the motion of the weights to or from the center of the shaft, but it is turned in a direction opposite to that in which *d* is turned. These two eccentrics, therefore, constitute a compound eccentric, the eccentricity or "throw" of which varies with the position of the weights, while the "lead" remains practically the same. Coiled springs *k* constantly press the weights *f* toward the center, and the action of these springs is more or less overcome by centrifugal force as the shaft *a* rotates with greater or less velocity. The higher the velocity the less will be the throw of the valve and the shorter the cut-off, and vice versa. Fig. 1 shows the weights in their extreme outward position, in which the throw *ab* is the least possible. Fig. 2 shows the extreme inward position of the weights, in which the throw *ab'* is the greatest possible. The range of variable cut-off is thus carried from simple lead to 0.7 of the stroke, and a very small percentage of change in the velocity is sufficient to change the cut-off from its least to its greatest limit.

the cut-off, maintaining a uniform speed of rotation under conditions of widely varying work. One of the most ingenious and scientific of this class is illustrated in the cut with an accompanying explanation. (4) A throttle-valve. (5) The induction-valve of a steam-engine. (6) The brake-band of a crab or crane which regulates the descent of a body raised by or suspended on a machine. (*b*) In heating apparatus: (1) A register. (2) A thermostat. (3) An automatic draft-damper for the furnace or fire-box of a steam-boiler. Also called *dampers-regulator*. (*c*) In *horol.*: (1) A clock of superior order, by comparison with which other time-pieces are regulated. (2) A clock which, being electrically connected with other clocks at a distance, causes them to keep time in unison with it. (3) A device (commonly a screw and small nut) by which the bob of a pendulum is raised or lowered, causing the clock to go faster or slower. (4) The fly of the striking mechanism of a clock. (See *fly*¹, 3(a)(1).) (5) A small lever which shortens or lengthens the hair-spring of a watch, thus causing the watch to go faster or slower according as the regulator is moved toward a part marked *P* or *S*. (*d*) In the electric light, the contrivance, usually an electromagnet, by which the carbon-points are kept at a constant distance, so that the light is steady (see *electric light*, under *electric*); or, in general, a contrivance for making the current produced by the dynamo-machines of constant strength.—**Many-light regulator**, a regulator for voltaic arc-lights, controlling numerous lights on one circuit.—**Regulator-box**. (*a*) A valve-chest or -box. (*b*) The original valve-motion of Watt's double-action condensing pumping-engine. It was a valve-box having a spindle through one of its sides, on which was a toothed sector working on a central bearing, and meshing with a rack attached to a valve. A tripping-lever attached to the sector and operated by the plug-tree caused the oscillations of the latter to open and close the valve.—**Regulator-cock**, one of the oil-cocks which admit oil to the steam-chest or valve-chest of a locomotive engine.—**Regulator-cover**, the cover or bonnet of a valve-chest or steam-chest of a steam-engine cylinder.—**Regulator-shaft** and **-levers**, in locomotive engines, the shaft and levers placed in front of the smoke-box when each cylinder has a separate regulator: now collectively

called *valve-gear* or *valve-motion*.—**Regulator-valve**, a throttle-valve.

reh (rā), *n.* [Hind.] A saline efflorescence rising to the surface and covering various extensive tracts of land in the Indo-Gangetic alluvial plain, rendering the soil worthless for cultivation. It consists chiefly of sodium sulphate mixed with more or less common salt (sodium chloride) and sodium carbonate. It is known in the Northwest Provinces of India as *reh*, and further west, in the Upper Punjab, as *kalar* or *kullar*.

Those who have travelled through Northern India cannot fail to have noticed whole districts of land as white as if covered with snow, and entirely destitute of vegetation. . . . This desolation is caused by *reh*, which is a white flocculent efflorescence, formed of highly soluble sodium salts, which are found in almost every soil. Where the subsoil water-level is sufficiently near the surface, the strong evaporating force of the sun's heat, aided by capillary attraction, draws to the surface of the ground the water holding these salts in solution, and these compel the water, which passes off in the form of vapour, to leave behind the salts it held as a white efflorescence.

A deer of the genus *Rangifer* or *Tarandus*, having horns in both sexes, and inhabiting arctic and cold temperate regions; the *Cervus tarandus*, *Rangifer tarandus*, or *Tarandus rangifer*.*

Reindeer (*Rangifer tarandus*).

It has branched, recurved, round antlers, the crowns of which are more or less palmated; the antlers of the male are much larger than those of the female, and are remarkable for the size and asymmetry of the brow-antler. The body is of a thick and square form, and the legs are shorter in proportion than those of the red-deer. The size varies much according to climate: about 4 feet 6 inches may be given as the average height of a full-grown specimen. The reindeer is keen of sight and swift of foot, being capable of maintaining a speed of 9 or 10 miles an hour for a long time, and can easily draw a weight of 200 pounds, besides the sledge to which it is usually attached when used as a beast of draft. Among the Laplanders the reindeer is a substitute for the horse, the cow, and the sheep, as it furnishes food, clothing, and the means of conveyance. The caribou of North America, if not absolutely identical with the reindeer, would seem to be at least a well-marked variety, usually called *R. caribou*. The American barren-ground reindeer has been described as a different species, *R. groenlandicus*. See also *caribou*.

Its nutritive properties depend chiefly on the gelatinous or starchy matter of which it is largely composed. Its taste is slightly pungent and acrid, and when boiled it forms a jelly possessing nutritive and tonic properties, and is sometimes eaten by man during scarcity of food, being powdered and mixed with flour. See *Cladonia* and *lichen*.

3. To have relation or connection.

There are also in divers rivers, especially that *relate* to,
or be near to the sea, as Winchester, or the Thames about
Windsor, a little Trout called a *Sanlet*.
J. Walton, Complete Angler, I. 4.

relate (rē-lāt'), *n.* [*< ML. relatum*, a relate, an
order, report, neut. of *L. relatus*, pp.: see *relate*,
v.] Anything considered as being in a relation
to another thing; something considered as be-
ing the first term of a relation to another thing.
Also *relatum*.

If the relation which agrees to heteronyms has a name,
one of the two relateds is called the *relate*: to wit, that
from which the relation has its name; the other the cor-
relate.
Burgersdicius.

Heteronymous, predicamental, etc., relates. See the
adjectives.—**Synonymous relates.** See *heteronymous*
relates.—**Transcendental relates.** See *predicamental*
relates.

related (rē-lāt'ed), *p. a. and n.* [Pp. of *relate, v.*]
I. *p. a.* 1. Recited; narrated.—2. Allied by
kindred; connected by blood or alliance, par-
ticularly by consanguinity: as, a person *related*
in the first or second degree.

Because ye're surnam'd like his grace;
Perhaps *related* to the race.
Burns, Dedication to Gavin Hamilton.

3. Standing in some relation or connection:
as, the arts of painting and sculpture are close-
ly *related*.

No one and no number of a series of *related* events can
be the consciousness of the series as *related*.
T. H. Green, Prolegomena to Ethics, § 16.

4. In *music*: (a) Of tones, belonging to a me-
lodic or harmonic series, so as to be susceptible
of close connection. Thus, the tones of a scale when
taken in succession are *melodically related*, and when
taken in certain sets are *harmonically related*. See *rela-*
tion, 8. (b) Of chords and tonalities, same as
related.

II. *n.* Same as *relate*. [Rare.]

Relateds are reciprocated. That is, every *related* is re-
ferred to a reciprocal correlate.
Burgersdicius, tr. by a Gentleman, I. 7.

relatedness (rē-lāt'ed-nes), *n.* The state or
condition of being related; affinity.

We are not strong by our power to penetrate, but by our
relatedness. The world is enlarged for us, not by new ob-
jects, but by finding more affinities and potencies in those
we have.
Emerson, Success.

relater (rē-lāt'ter), *n.* [*< relate + -er*]. One
who relates, recites, or narrates; a historian.
Also *relator*.

Her husband the *relater* she prefer'd
Before the angel, and of him to ask
Chose rather.
Milton, P. L., viii. 52.

relation (rē-lā'shon), *n.* [*< ME. relation, rela-*
cion, < OF. relation, F. relation = Pr. *relacion* = Sp. *relação* = It. *relazione*, *<*
L. relatio(n-), a carrying back, bringing back,
restoring, repaying, a report, proposition, mo-
tion, hence a narration, relation, also reference,
regard, respect, *< referre*, pp. *relatus*, refer, re-

late: see *refer, relate*.] 1. The act of relating
or telling; recital; narration.

He schalle telle it anon to his Conseille, or discovere it
to sunn men that wille make *relacion* to the Emperour.
Manderiville, Travels, p. 235.

I shall never forget a story of our host Zachary, who on
the *relation* of our peril told us another of his owne.
Evelyn, Diary, Oct. 16, 1644.

I remember to have heard an old gentleman talk of the
civil wars, and in his *relation* give an account of a general
officer.
Steele, Spectator, No. 497.

2. That which is related or told; an account;
narrative: formerly applied to historical nar-
rations or geographical descriptions: as, the
Jesuit *Relations*.

Sometime the Countrie of Strabo, to whom these our
Relations are so much indebted.

Purchas, Pilgrimage, p. 320.

Oftimes *relations* heertofore accounted fabulous have
bin after found to contain in them many foot-steps and
reliques of somthing true.
Milton, Hist. Eng., I.

Political and military *relations* are for the greater part
accounts of the ambition and violence of mankind.
Burke, Abridg. of Eng. Hist.

3. A character of a plurality of things; a fact
concerning two or more things, especially and
more properly when it is regarded as a predi-
cate of one of the things connecting it with the
others; the condition of being such and such
with regard to something else: as, the *relation*
of a citizen to the state; the *relation* of demand
and supply. Thus, suppose a locomotive blows off
steam; this fact constitutes a relation between the lo-
comotive and the steam so far as the "blowing" is conceived
to be a character of the locomotive, and another relation
so far as the "being blown" is conceived as a character of
the steam, and both these relations together are embraced
in the same relationship, or plural fact. This latter, also
often called a *relation*, is by logicians called the *founda-*
tion of the relation. The two or more subjects or things
to which the plural fact relates are termed the *relates* or
correlates; the one which is conceived as subject is spe-
cifically termed the *subject* of the relation, or the *relate*;
the others the *correlates*. Words naming things in their
character as relates are called *relatives*, as father, cousin.
A set of relatives referring to the same relationship ac-
cording as one or another object is taken as the relate are
called *correlatives*: such are buyer, seller, commodity,
price. The logical nomenclature of relations depends on
the consideration of *individual relations*, or relations sub-
sisting between the individuals of a single set of cor-
relates, as opposed to *general relations*, which, really or in
conception, subsist between many such sets. Relations are
either *dual*—that is, connecting couples of objects, as in
the examples above—or *plural*—that is, connecting more
than two correlates, as the relation of a buyer to the
seller, the thing bought, and the price. Every individual
dual relation is either a relation of a thing to itself or a
relation of a thing to something else. *Logical relations* are
those which are known from logical reflection: opposed
to *real relations*, which are known by generalization and
abstraction from ordinary observations. The chief logi-
cal relations are those of *impossibility*, *coexistence*,
identity, and *otherness*. Real dual relations are of five
classes: (1) *differences* or *dis-relations*, being relations
which nothing can bear to itself, as being greater than;
(2) *sibi-relations* or *concurrences*, being relations which
nothing can bear to anything else, as self-consciousness;
(3) *agreements*, or relations which everything bears to it-
self, as similarity; (4) relations which everything bears
to everything else, which may be called *distances*; and
(5) *variform relations*, which some things only bear to
themselves, and which subsist between some pairs of
things only. Other divisions of relations are important in
logic, as the following. An *iterative* or *repeating relation*
is such that a thing may at once be in that relation and
its converse to the same or different things, as the relation
of father to son, or spouse to spouse: opposed to a *final*
or *non-repeating relation*, as that of husband to wife. An
equiparance or *convertible relation*, opposed to a *dispari-*
parance or *inconvertible relation*, is such that, if any thing
is in that relation to another, the latter is in the same re-
lation to the former, as that of cousin. A relation which
cannot subsist between two things reciprocally, as that of
greater and less, may be called an *irreciprocable relation*.
Opposed to a *reciprocable relation*, which admits recip-
rocal as possible merely. A relation such that if A is so
related to B, and B so related to C, then A is so related to
C, is called a *transitive*, in opposition to an *intransitive*
relation. A relation such that if A is so related to some-
thing else, C, there is a third thing, B, which is so related
to C, and to which A is so related, is called a *concatenated*,
in opposition to an *inconcatenated relation*. A relation
subsisting between objects in an endless or self-returning
series is called an *inexhaustible*, in opposition to an *ex-*
haustible relation. If there is a self-returning series, the
relation is termed *cyclic*, in opposition to *acyclic*. A transi-
tive relation such that of any two objects of a certain cate-
gory one has this relation to the other may be called a
linear relation; and the series of objects so formed may
be called the *line* of the relation. According as this is
continuous or discontinuous, finite or infinite, and in the
latter case discretely or absolutely, these designations
may be applied to the relation. According to the nom-
inalistic (including the conceptualistic) view, a relation is
a mere product of the mind. Adding to this doctrine that
of the relativity of knowledge, that we know only relations,
Kant reached his conclusion that things in themselves are
absolutely incognizable. But most Kantian students come
to deny the existence of things in themselves, and so reach
an idealistic realism which holds relations to be as real as
any facts. The realistic view is expressed in the dictum
of Scotus that every relation without which, or a term of
which, its foundation cannot be is, in the thing (*realiter*),
identical with that foundation—that is, what really is is

a fact relating to two or more things, and that fact viewed as a predicate of one of those things is the relation.

Thus is *relation* rect, ryht as adiectif and substantif A-cordeth in alle kyndes with his antecedent.

Piers Plowman (C), iv. 363.

The last sort of complex ideas is that we call *relation*, which consists in the consideration and comparing one idea with another. Locke, Human Understanding, II. 12.

The only difference between relative names and any others consists in their being given in pairs; and the reason of their being given in pairs is not the existence between two things of a mystical bond called a *relation* and supposed to have a kind of shadowy and abstract reality, but a very simple peculiarity in the concrete fact which the two names are intended to mark.

J. S. Mill, Note to James Mill's Human Mind, xiv. 2.

In natural science, I have understood, there is nothing petty to the mind that has a large vision of *relations*.

George Eliot, Mill on the Floss, IV. 1.

Most *relations* are feelings of an entirely different order from the terms they relate. The *relation* of similarity, e. g., may equally obtain between jasmine and tuberose, or between Mr. Browning's verses and Mr. Story's; it is itself neither odorous nor poetical, and those may well be pardoned who have denied to it all sensational content whatever.

W. James, Mind, XII. 13.

4. Intimate connection between facts; significant bearing of one fact upon another.

For the intent and purpose of the law

Hath full *relation* to the penalty.

Which here appeareth due upon the bond.

Shak., M. of V., IV. 1. 248.

The word *relation* is commonly used in two senses considerably different from each other. Either for that quality by which two ideas are connected together in the imagination, and the one naturally introduces the other . . . ; or for that particular circumstance in which . . . we may think proper to compare them. . . . In a common way we say that "nothing can be more distant than such or such things from each other, nothing can have less *relation*," as if distance and *relation* were incompatible.

Hume, Human Nature, part I. § 5.

5. Connection by consanguinity or affinity; kinship; tie of birth or marriage; relationship.

Relations dear, and all the charities

Of father, son, and brother, first were known.

Milton, P. L., IV. 756.

6. Kindred; connection; a group of persons related by kinship. [Rare.]

He hath need of a great stock of piety who is first to provide for his own necessities, and then to give portions to a numerous *relation*.

Jer. Taylor, Works (ed. 1835), I. 644.

7. A person connected by consanguinity or affinity; a kinsman or kinswoman; a relative.

Sir, you may spare your application,

I'm no such beast, nor his *relation*.

Pope, Imit. of Horace, I. vii. 60.

I am almost the nearest *relation* he has in the world, and am entitled to know all his dearest concerns.

Jane Austen, Pride and Prejudice, Ivi.

8. In *math.*: (a) A ratio; proportion. (b) A connection between a number of quantities by which certain systems of values are excluded; especially, such a connection as may be expressed by a plexus of general equations.—9. In *music*, that connection or kinship between two tones, chords, or keys (tonalities) which makes their association with each other easy and natural. The relation of tones is perceived by the ear without analysis. Physically it probably depends upon how far the two series of upper partial tones or harmonics coincide. Thus, a given tone is closely related to its perfect fifth, because the 2d, 5th, 8th, 11th, etc., harmonics of the one are respectively identical with the 1st, 3d, 5th, 7th, etc., of the other; while for converse reasons it is hardly at all related to its minor second. Tones that have but a distant relation to each other, however, are often both closely related to a third tone, and then, particularly if they are associated together in some melodic series, like a scale, may acquire a close relation. Thus, the seventh and eighth tones of a major scale have a close relation which is indirectly harmonic, but apparently due to their habitual melodic proximity. The relation of chords depends primarily on the identity of one or more of their respective tones. Thus, a major triad is closely related to a minor triad on the same root, or to a minor triad on the minor third below itself, because in each case there are two tones in common. Thus, the tonic triad of a key is related to the dominant and subdominant triads through the identity of one of its tones with one of theirs. As with tones, chords having but a distant relation to each other may acquire a relation through their respective close relations to a third chord, especially if habitually brought together in harmonic progressions. Thus, the dominant and subdominant triads of a key have a substantial but indirect relation; and, indeed, a relation is evident between all the triads of a key. The relation of keys (tonalities) depends properly on the number of tones which they have in common; though it is often held that a key is closely connected with every key whose tonic triad is made up of its tones. Thus, a major key is most intimately related to the major keys of its dominant and subdominant and to the minor key of its submediant, because each of them differs from it by but one tone, and also to the minor keys of its mediant and supertonic, because their tonic triads are also composed of its tones. Hence a major key and the minor key of its submediant are called mutually relative (*relative major* and *relative minor*), in distinction from the tonic major and tonic minor, which are more distantly related. When carefully analyzed, the fact of relation is

found to be profoundly concerned in the entire structure and development of music. It has caused the establishment of the major diatonic scale as the norm of all modern music. It is the kernel of tonality, of harmonic and melodic progression, of form in general, and of many extended forms in particular.

10. In *law*: (a) A fiction of law whereby, to prevent injustice, effect is given to an act done at one time as if it had been done at a previous time, it being said to have *relation* back to that time: as, where a deed is executed and acted on, but its delivery neglected, the law may give effect to its subsequent delivery by *relation* back to its date or to its execution, as may be equitable. (b) Suggestion by a relator; the statement or complaint of his grievance by one at whose instance an action or special proceeding is brought by the state to determine a question involving both public and private right.—11. In *arch.*, the direct dependence upon one another, and upon the whole, of the different parts of a building, or members of a design.—Abelian *relation*, a relation expressed by certain identical linear equations given by Abel connecting roots of unity with the roots of the equation which gives the values of the elliptic functions for rational fractions of the periods.—Accidental *relation*, an indirect relation of A to C, constituted by A being in some relation to B, and B being in an independent relation to C. Thus, if a man throws away a date-stone, and that date-stone strikes an invisible genie, the relation of the man to the genie is an accidental one.—Actual *relation*. See *actual*.—Aggregate *relation*. (a) A relation resulting from a disjunctive conjunction of several relations, such that, if any of the latter are satisfied, the aggregate relation is satisfied. (b) Same as composite *relation* (a). [This is the signification attached to the word by Cayley, contrary to the established terminology of logic.]—Allo *relation*, a relation of such a nature that a thing cannot be in that relation to itself: as, being previous to.—Aptitudinal *relation*. See *aptitudinal*.—Categories of *relation*. See *category*, 1.—Composite *relation*. (a) A relation consisting in the simultaneous existence of several relations. (b) Same as aggregate *relation* (a). [This is the signification attached to the phrase by Cayley, in opposition to the usage of logicians.]—Confidential, cyclical, discriminant *relation*. See the adjectives.—Definite *relation*, a relation unlike any relation of the same relate to other correlates. [This is Kempe's nomenclature, but is objectionable. Peculiar *relation* would better express the idea.]—Distributively satisfied composite *relation*. See *distributively*.—Double *relation*, dual *relation*, relation between a pair of things, or between a relate and a single correlate.—Dynamic *relations*. See *dynamic*.—Enharmonic *relation*. See *enharmonic*.—Exterior *relations*. See *exterior*.—Extrinsic *relation*, a relation which is established between terms already existing.—False or inharmonic *relation*, in *music*. See *false*.—In *relation* to, in the characters that connect the subject with the correlate which is the object of the proposition to: as, music in *relation* to poetry (music in those characters that connect it with poetry).—Intrinsic *relation*. See *intrinsic*.—Involutorial *relation*. See *involutorial*.—Irregular *relation*, a relation not regular.—Jacobian *relation*, the relation expressed by equating the Jacobian to zero.—K-fold *relation*, a relation which reduces by *k* the number of independent ways in which a system of quantities may vary.—Legal *relation*, the aggregate of legal rights and duties characterizing one person or thing in respect to another.—Omni *relation*, a relation expressed by a system of linear equations. [With Legendre, *omni* means having the differential coefficient constantly of one sign; but Cayley uses the word as a synonym of *homoplasial* or *linear*.]—Order of a *relation*, in *math*. See *order*, 12.—Parametric *relation*, a relation involving parameters, or variables over and above the coordinates.—Plural *relation*, a relation between a relate and two or more correlates, as when A aims a shot, B, at C.—Predicamental *relation*, a relation which comes under Aristotle's category of relation.—Prime *relation*, a relation not resulting from the conjunction of relations alternatively satisfied.—Real *relation*, a relation the statement of which cannot be separated into two facts, one relating to the relate and the other to the correlate, such as the relation of Cain to Abel as his killer. For the facts that Cain killed somebody and that Abel was killed do not together make up the fact that Cain killed Abel: opposed to *relation of reason*.—Regular *relation*, a relation of definite manifoldness. [So defined by Cayley; but it would have been better to denominate this a *homoplasial relation*, reserving the term *regular relation* for one which follows one law, expressible by general equations, for all values of the coordinates—this meaning according better with that usually given to *regular*.]—Relation of disquarance, a relation which confers unlike names upon relate and correlate.—Relation of equiparance, a relation which confers the same relative name upon relate and correlate: thus, the being a cousin of somebody is such a relation, for if A is cousin to B, B is cousin to A.—Relation of reason, a relation which depends upon a fact which can be stated as an aggregate of two facts (one concerning the relate, the other concerning the correlate), such that the annihilation of the relate or the correlate would destroy only one of these facts, but leave the other intact: thus, the fact that Franklin and Rumford were both scientific Americans constitutes a relationship between them with two correlative relations; but these are *relations of reason*, because the two facts are that Franklin was a scientific American and that Rumford was a scientific American, the first of which facts would remain true even if Rumford had never existed, and the second even if Franklin had never existed.—Resultant *relation*, a relation between parameters involved in a superdeterminate relation.—Self-relation. (a) A relation of such a sort that a thing can be in that relation to itself: as, being the killer of; but better (b) a relation of such a sort that nothing can be so related to anything else, as the relations of self-consciousness,

self-depreciation, self-help, etc.—Superdeterminate *relation*, a relation whose manifoldness is as great as or greater than the number of coordinates.—Transcendental *relation*, a relation which does not come under Aristotle's category of relation, as cause and effect, habit and object.—Syn. 1. Narration, Recital, etc. See *account*.—3. Attitude, connection.—5. Affiliation.—5 and 7. Relation, Relative, Connection. When applying to family affiliations, *relation* is used of a state or of a person, but in the latter sense *relative* is much better; *relative* is used of a person, but not of a state; *connection* is used with equal propriety of either person or state. *Relation* and *relative* refer to kinship by blood; *connection* is increasingly restricted to ties resulting from marriage.—6. Kindred, kin.

relational (rē-lā'shon-al), a. [*< relation + -al.*]

1. Having relation or kindred.

We might be tempted to take these two nations for *relational* stems. Tooke.

2. Indicating or specifying some relation: used in contradistinction to *notional*: as, a *relational* part of speech. Pronouns, prepositions, and conjunctions are *relational* parts of speech.

relationality (rē-lā'shon-al-i-ti), n. [*< relational + -ity.*] The state or property of having a relational force.

But if the remarks already made on what might be called the *relationality* of terms have any force, it is obvious that mental tension and conscious intensity cannot be equated to each other. J. Ward, Mind, XII. 56.

relationism (rē-lā'shon-izm), n. [*< relation + -ism.*] 1. The doctrine that relations have a real existence.

Relationism teaches . . . that things and relations constitute two great, distinct orders of objective reality, inseparable in existence, yet distinguishable in thought. F. E. Abbot, Scientific Theism, Intro., II.

2. The doctrine of the relativity of knowledge.

relationist (rē-lā'shon-ist), n. [*< relation + -ist.*] 1. A relative; a relation. Sir T. Browne.

—2. An adherent of the doctrine of relationism.

relationship (rē-lā'shon-ship), n. [*< relation + -ship.*] 1. The state of being related by kindred, affinity, or other alliance.

Faith is the great tie of *relationship* betwixt you [and Christ]. Chalmers, On Romans viii. 1 (ed. R. Carter).

Mrs. Mungford's conversation was incessant regarding the Ringwood family and Firmus's *relationship* to that noble house. Thackeray, Philip, xxi.

2. In *music*, same as *relation*, 8. Also called *tone-relationship*.

relational (rē-lā'tiv), a. and n. [*< relation + -al.*] Pertaining to relative words or forms.

Conjunctions, prepositions (personal, relative, and interrogative), *relational* contractions.

E. A. Abbott, Shakespearean Grammar (cited in The Nation, Feb. 16, 1871, p. 110).

relative (rē-lā'tiv), a. and n. [*< ME. relatif, < OF. (and F.) relatif = Pr. relatiu = Sp. P. It. relativo, < LL. relatus, having reference or relation, < L. relatus, pp. of referre, refer, relate: see refer, relate.*] I. a. 1. Having relation to or bearing on something; close in connection; pertinent; relevant; to the purpose.

The devil hath power

To assume a pleasing shape; yea, and perhaps . . .

Abuses me to damn me. I'll have grounds

More *relative* than this. Shak., Hamlet, II. 2. 633.

2. Not absolute or existing by itself; considered as belonging to or respecting something else; depending on or incident to relation.

Everything sustains both an absolute and a *relative* capacity: an absolute, as it is such a thing, endowed with such a nature; and a *relative*, as it is a part of the universe, and so stands in such a relation to the whole.

South.

Not only simple ideas and substances, but modes also, are positive beings: though the parts of which they consist are very often *relative* one to another.

Locke, Human Understanding, II. xxvi. § 6.

Religion, it has been well observed, is something *relative* to us; a system of commands and promises from God towards us. J. H. Newman, Parochial Sermons, I. 317.

3. In *gram.*, referring to an antecedent; introducing a dependent clause that defines or describes or modifies something else in the sentence that is called the antecedent (because it usually, though by no means always, precedes the relative): thus, he *who* runs may read; he lay on the spot *where* he fell. Pronouns and pronominal adverbs are relative, such adverbs having also the value of conjunctions. A relative word used without an antecedent, as implying in itself its antecedent, is often called a *compound relative*: thus, *who* breaks pays; *I* saw *where* he fell. Relative words are always either demonstratives or interrogatives which have acquired secondarily the relative value and use.

4. Not intelligible except in connection with something else; signifying a relation, without stating what the correlate is: thus, *father*, *bet-ter*, *west*, etc., are *relative* terms.

Profundity, in its secondary as in its primary sense, is a *relative* term. Macaulay, Sadler's Ref. Refuted.

5. In music, having a close melodic or harmonic relation. Thus, *relative chords*, in a narrow sense, the triads of a given key (tonality) having as roots the successive tones of its scale; *relative keys*, keys (tonalities) having several tones in common, thus affording opportunity for easy modulation back and forth, or, more narrowly, keys whose tonic triads are relative chords of each other; *relative major*, *relative minor*, a major key and the minor key of its submediant regarded with respect to each other. Also *related*, *parallel*. See *cut under chord*, 4.—**Relative beauty**, beauty consisting in the adaptation of the object to its end.—**Relative chronology**, in *geol.*, the geological method of computing time, as opposed to the *absolute* or *historical* method.—**Relative end, ens, equilibrium**. See the nouns.—**Relative enunciation**, an enunciation whose clauses are connected by a relative: as, "Wheresoever the carcass is, there will the eagles be gathered together."—**Relative gravity**. (a) The acceleration of gravity at a station referred to that at another station, and not expressed in terms of space and time. (b) Same as *specific gravity* (which see, under *gravity*).—**Relative ground of proof**, a premise which itself requires proof.—**Relative humidity**, *hypermetropia*, *locality*. See the nouns.—**Relative motion**. See *motion*.—**Relative opposites**, the two terms of any dual relation.—**Relative place**, the place of one object as defined by the situations of other objects.—**Relative pleasure or pain**, a state of feeling which is pleasurable or painful by force of contrast with the state which preceded it.—**Relative pronoun, proposition, etc.** See the nouns.—**Relative syllogism**, a syllogism whose major premise is a relative enunciation: as, Where Christ is, there will also the faithful be; but Christ is in heaven; therefore there also will the faithful be.—**Relative term**, a term which, to become the complete name of any class, requires to be completed by the annexation of another name, generally of another class: such terms are, for example, father of, the qualities of, tangent to, identical with, man that is, etc. Strictly speaking, all adjectives are of this nature.—**Relative time**, the sensible measure of any part of duration by means of motion.

II. n. 1. Something considered in its relation to something else; one of two things having a certain relation.—**2.** A person connected by blood or affinity; especially, one allied by blood; a kinsman or kinswoman; a relation.

Our friends and relatives stand weeping by,
Dissolv'd in tears to see us die.

Pomfret, Prospect of Death.

There is no greater bugbear than a strong-willed relative in the circle of his own connections.

Hawthorne, Seven Gables, xl.

3. In gram., a relative word; a relative pronoun or adverb. See 1, 3.—**4. In logic**, a relative term.—**Logic of relatives**, that branch of formal logic which treats of relations, and reasonings concerning them.—**Syn. 2.** Connection, etc. See *relation*.

relatively (rel'a-tiv-ly), *adv.* In a relative manner; in relation or respect to something else; with relation to each other and to other things; not absolutely; comparatively: often followed by *to*: as, his expenditure in charity was large *relatively* to his income.—**Relatively identical**, the same in certain respects.—**Relatively prime**. See *prime*, 7.

relativity (rel'a-tiv-nes), *n.* The state of being relative or having relation.

Therefore, while for a later period of the dialect-life of Hellas the expression "dialect" is one of peculiar *relativity*, it is a justifiable term for certain aggregations of morphological and syntactical phenomena in the earlier periods of language, when dialect-relations were more sharply defined.

Amer. Jour. Philol., VII. 444.

relativity (rel'a-tiv'i-ti), *n.* [= F. *relativité*, < NL. **relativitas* (t-), < LL. *relativus*, relative: see *relative*.] **1.** The character of being relative; relativity; the being of an object as it is by force of something to which it is relative. Specifically—**2.** Phenomenality; existence as an immediate object of the understanding or of experience; existence only in relation to a thinking mind.—**The doctrine of the relativity of existence**, the doctrine that the real existence of the subject, and also of the object, depends on the real relation between them.—**The doctrine of the relativity of knowledge**. The phrase *relativity of knowledge* has received divergent significations. (a) The doctrine that it is impossible to have knowledge of anything except by means of its relations to the mind, direct and indirect, cognized as relations. (b) The doctrine of phenomenalism, that only appearances can be known, and that the relations of these appearances to external substrata, if such there be, are completely incognizable. This doctrine is sometimes associated with a denial of the possibility of any knowledge of relations as such, or at least of any whose terms are not independently present together in consciousness. It would therefore better be denominated *the doctrine of the impossibility of relativity of cognition*. (c) The doctrine that we can only become conscious of objects in their relations to one another. This doctrine is almost universally held by psychologists.

Relative and correlative are each thought through the other, so that in enunciating *relativity* as a condition of the thinkable—in other words, that thought is only of the relative—this is tantamount to saying that we think one thing only as we think two things mutually and at once; which again is equivalent to the doctrine that the absolute (the non-relative) is for us incognizable, and even inconceivable.

Sir W. Hamilton, Metaph., App. V. (c).

When a philosopher lays great stress upon the *relativity* of our knowledge, it is necessary to cross-examine his writings, and compel them to disclose in which of its many degrees of meaning he understands the phrase. . . .

To most of those who hold it, the difference between the Ego and the Non-ego is not one of language only, nor a formal distinction between two aspects of the same reality, but denotes two realities, each having a separate existence, and neither dependent on the other. . . . They believe that there is a real universe of "things in themselves," and that whenever there is an impression on our senses, there is a "thing in itself," which is behind the phenomenon, and is the cause of it. But as to what this thing is "in itself," we, having no organs except our senses for communicating with it, can only know what our senses tell us; and as they tell us nothing but the impression which the thing makes upon us, we do not know what it is in itself at all. . . . Of the ultimate realities, as such, we know the existence, and nothing more. . . . It is in this form that the doctrine of the relativity of knowledge is held by the greater number of those who profess to hold it, attaching any definite idea to the term.

J. S. Mill, Examination of Hamilton, II.

Coleridge, Biog. Lit., iii.

reliable (rē-li'a-bl), *a.* [*< rely¹ + -able*.] That may be relied on; fit or worthy to be relied on; worthy of reliance; to be depended on; trustworthy. [This word, which involves a use of the suffix *-able* superficially different from its more familiar use in *provable*, 'that may be proved', *eatable*, 'that may be eaten', etc., has been much objected to by purists on philological grounds. The objection, however, really has no philological justification, being based on an imperfect knowledge of the history and uses of the suffix *-able*, or on a too narrow view of its office. Compare *available*, *conversable*, *dispensable*, *lawful*, and many other examples collected by Fitzedward Hall in his work cited below, and see *-able*. As a matter of usage, however, the word is shunned by many fastidious writers.]

The Emperor of Russia may have announced the restoration of monarchy as exclusively his object. This is not considered as the ultimate object, by this country, but as the best means, and most *reliable* pledge, of a higher object, viz. our own security, and that of Europe.

4. An object held in reverence or affection because connected with some sacred or beloved person deceased; specifically, in the *Rom. Cath. Ch.*, the *Gr. Ch.*, and some other churches, a saint's body or part of it, or an object supposed to have been connected with the life or body of Christ, of the Virgin Mary, or of some saint or martyr, and regarded therefore as a personal memorial worthy of religious veneration. Relics are of three classes: (a) the entire bodies or parts of the bodies of venerated persons, (b) objects used by them or connected with their martyrdom, and (c) objects connected with their tombs or sanctified by contact with their bodies. Relics are preserved in churches, convents, etc., to which pilgrimages are on their account frequently made. The miraculous virtues which are attributed to them are defended by such instances from Scripture as that of the miracles which were wrought by the bones of Elisha (2 *Ki. xiii. 21*).

We speak also of the *remains* of a feast, of a city, building, monument, etc. *Relics* always suggests antiquity: as, the *relics* of ancient sovereigns, heroes, and especially saints. The singular of *relics* is used; that of *remains* is not.

relic-knife (rel'ik-nif), *n.* A knife made so as to contain the relic or supposed relic of a saint, either in a small cavity provided for the purpose in the handle, or by incorporating the relic, if a piece of bone or the like, in the decoration of the handle itself. *Jour. And I am sick at heart. *Shak.*, *Hamlet*, i. 1. 8.

5. One who relieves another, as from a post of duty; a soldier who relieves another who is on guard; collectively, a company of soldiers who relieve others who are on guard.

Harper's Mag., LXXIX. 820.

6. In *sculpt.*, *arch.*, etc., the projection (in *painting*, the apparent projection) of a figure or feature from the ground or plane on which it is formed. Relief is, in general, of three kinds: high relief (*alto-relievo*), low relief (*basso-relievo*, *bas-relief*), and middle or half relief (*mezzo-relievo*). The distinction lies in the degree of projection. High relief is that in which

High Relief.—The Rondanini mask of Medusa in the Glyptothek, Munich—illustrating the late beautiful type of the Gorgon.

the figures project at least one half of their natural circumference from the background. In low relief the figures project but slightly from the ground, in such a manner that no part of them is entirely detached from it, as in medals, the chief effect being produced by the treatment of light and shadow. Middle or half relief is intermediate between the other two. The varieties of relief are still further distinguished as *stiacciato rilievo*, or very flat relief, the lowest possible relief, of which the projection in parts hardly exceeds the thickness of a sheet of paper; and *cavo-rilievo*, hollow relief, also called *intaglio rilienato*, or *cartonaglyphic sculpture*, an Egyptian form of relief obtained by cutting a furrow with sloping sides around a figure previously outlined on a stone surface, leaving the highest parts of the finished work on a level with the original surface-plane. See also cut in next column, and cuts under *orant*, *Proserpine*, *alto-rilievo*, and *bas-relief*.

You find the figures of many ancient coins rising up in a much more beautiful *relief* than those on the modern.

Hollow-relief or Cavo-rilievo Sculpture.—Court of Edfu, Egypt; Ptolemaic age, 2d century B. C.

8. In *her.*, the supposed projection of a charge from the surface of the field, represented by shading with a heavier bounding-line on the sinister side and toward the base than on the dexter side and toward the chief. Thus, if an escutcheon is divided into seven vertical stripes, alternately red and white, it would not be blazoned pale of seven gules and argent, as the rule is that pale is always of an even number, but the sinister side of three alternate stripes would be shaded to indicate relief, and the blazoning would be gules, three pallets argent, the assumption being that the pallets are in relief upon the field.

9. In *phys. geog.*, the form of the surface of any part of the earth, considered in the most general way, and with special regard to differences of elevation: little used except in the name *relief-map*, by which is meant a geographical or geological map in which the form of the surface is expressed by elevations and depressions of the material used. Unless the scale of such relief maps is very large, there must be considerable exaggeration, because differences of vertical elevations in nature are small as compared with superficial extent. Relief-maps are occasionally made by preparing a model of the region it is desired to exhibit, and then photographing this model under an oblique illumination. The relief of the surface is also frequently indicated on maps by various colors or by a number of tints of one color. Both hachure and contour-line maps also indicate the relief of the surface, to a greater or less extent, according to their scale and artistic perfection. Thus, the Du-four map of Switzerland, especially when photographed down to a small size, has in a very striking degree the effect of a photograph from an actual model, although in reality a hachure-map.

10. In *fort.*, the perpendicular height of the interior crest of the parapet above the bottom of the ditch.—11. Prominence or distinctness given to anything by something presenting a contrast to it, or brought into close relation with or proximity to it; a contrast.

13†. What is picked up; fragments left; broken meat given in alms.

After dener, ther shall come all ffre sowerys, and take the *relief* of the mete and drynke that the forsayde M. and shopholderis levyth. *English Gilda* (E. E. T. S.), p. 315.

14. In *law*, that which a court of justice awards to a suitor as redress for the grievance of which he complains.—15. In *feudal law*, a fine or composition which the heir of a tenant holding by knight's service or other tenure paid to the lord at the death of the ancestor, for the privilege of succeeding to the estate, which, on strict feudal principles, had lapsed or fallen to the lord on the death of the tenant. This relief consisted of horses, arms, money, etc., the amount of which was originally arbitrary, but afterward fixed by law. The term is still used in this sense in Scots law, being a sum exigible by a feudal superior from the heir who enters on a feu. Also called *casualty of relief*.

On taking up the inheritance of lands, a *relief* [was paid to the king]. The *relief* originally consisted of arms, armour and horses, and was arbitrary in amount, but was subsequently "ascertained," that is, rendered certain, by the Conqueror, and fixed at a certain quantity of arms and habiliments of war. After the assize of arms of Henry II., it was commuted for a money payment of 100s. for every knight's fee, and as thus fixed continued to be payable ever afterwards. *S. Dowell*, *Taxes in England*, I. 25.

Absolute relief, in *fort.*, the height of any point of a work above the bottom of the ditch.—**Alternative relief**, in *law*, different modes of redress asked in the alternative, usually because of uncertainty as to some of the facts, or because of a discretionary power in the court to award either.—**Bond of relief**. See *bond* 1.—**Constructive relief**, in *fort.*, the height of any point of a work above the plane of construction.—**Conversion of relief**. In 1847 the Relief and United Secession churches amalgamated, forming the United Presbyterian Church.—**Relief law**. The art of constructing homological figures in space, and of determining the relations of the parts of bas-reliefs, theatrical settings, etc., to make them look like nature. Every such representation refers to a fixed center of perspective and to a fixed plane of homology. The latter in a theater setting is the plane in which the actors generally stand; in a bas-relief it is the plane of life-size figures. Every natural plane is represented by a plane cutting it in a line lying in the plane of homology. Every natural point is represented by a point in the same ray from the center of perspective. The plane of homology represents itself, and the center of perspective represents itself. One other point can be taken arbitrarily to represent a given point. There is a vanishing plane, parallel to the plane of homology, which represents the portions of space at an infinite distance.

See *evidences of Christianity*, under *Christianity*.—**Experimental religion**. See *experimental*.—**Natural religion**, that knowledge of and reverent feeling toward God, and that knowledge and practice of our duties toward our fellow-men, which is based on and derived from nature, apart from revelation.—**Religion of Humanity**. See *experience*.—**To get religion**. See *get*, 1. *Religion*, *Devotion*, *Piety*, *Sanctity*, *Saintliness*, *Godliness*, *Holiness*, *Religiosity*. In the subjective aspect of these words *religion* is the most general, as it may be also the most formal or external; in this sense it is the place of the will and character of God in the heart, so that they are the principal object of regard and the controlling influence. *Devotion* and *piety* have most of fervor. *Devotion* is a religion that consecrates itself, being both a close attention to God with complete inward subjection and an equal attention to the duties of religion. *Piety* is religion under the aspect of filial feeling and conduct, the former being the primary idea. *Sanctity* is generally used objectively; subjectively it is the same as *holiness*. *Saintliness* is more concrete than *sanctity*, more distinctly a quality of a person, likeness to a saint, ripeness for heaven. *Godliness* is higher than *saintliness*; it is likeness to God, or the endeavor to attain such likeness, fixed attention given immediately to God, especially obedience to his will and endeavor to copy his character. *Holiness* is the most absolute of these words; it is moral and religious wholeness, completeness, or something approaching so near to absolute freedom from sin as to make the word appropriate; it includes not only being free from sin, but refusing it and hating it for its own sake. *Religiosity* is not a very common nor a very euphonious word, but seems to meet a felt want by expressing a susceptibility to the sentiments of religion, awe, reverence, admiration for the teachings of religion, etc., without much disposition to obey its commands.

I made no spare, sir. Shak., Hen. VIII., v. 4. 20.
What madness moves you, matrons, to destroy
The last *remainders* of unhappy Troy?
Dryden, Æneid, v.

2. In *math.*, the sum or quantity left after subtraction or after any deduction; also, the part remaining over after division: thus, if 19 be divided by 4, the *remainder* is 3, because 19 is three more than an exact multiple of 4. In the old arithmetics called the *remainder*. — 3. In *law*, a future estate so created as to take effect in possession and enjoyment after another estate (as a life-interest) is determined; a remnant of an estate in land, depending upon a particular prior estate, created at the same time, and by the same instrument, and limited to arise immediately on the determination of that estate. (*Kent*.) It is thus distinguished from a *reversion*, which is the estate which by operation of law arises in the grantor or his heirs when a limited estate created without creating also a remainder comes to an end; and distinguished also from an *executory interest*, which may take effect although there be no prior estate upon the termination of which it is to commence in possession. At the time when by the common law no grant could be made

but by livery of seizin, a person who wished to give to another a future estate was obliged to create at the same time an intermediate estate commencing immediately, and he could limit this temporary estate by the event which he wished to fix for the commencement of the ultimate estate, which was hence called the *remainder* — that is, what remained after the precedent or particular estate — and was said to be supported by the precedent or particular estate. (See *particular estate* and *executory estate*, both under *estate*.) A remainder is *vested* when the event which will terminate the precedent estate is certain to happen, and the person designated to take in remainder is in existence. The fact that the person may not survive to enjoy the estate, or that others may come into existence who will also answer the designation and therefore be entitled to share it with him, does not prevent the *remainder* from being deemed vested meanwhile.

With Julius Caesar, Decimus Brutus had obtained that interest, as he set him down in his testament for heir in *remainder* after his nephew. Bacon, Friendship (ed. 1887).

4. In the *publishing trade*, that which remains of an edition the sale of which has practically ceased, and which is sold out at a reduced price.

In 1843 he felt strong enough to start as a publisher in Soho Square, his main dealings before this having been in *remainders*, and his one solitary publication a failure. *Athenæum*, No. 3191, p. 850.

Contingent remainder, in *law*, a remainder which is not vested. The epithets *contingent* and *vested* are, however, often loosely used to indicate the distinction between remainders of which the enjoyment is in any way contingent and others. — **Cross remainder**, in *law*, that state of affairs in which each of two grantees or devisees has reciprocally a remainder in the property in which a particular estate is given to the other. Thus, if land be devised, one half to A for life with remainder to B in fee simple, and the other half to B for life with remainder to A in fee simple, these remainders are called *cross remainders*. Cross remainders arise on a grant to two or more as tenants in common, a particular estate being limited to each of the grantees in his share, with remainders to the other or others of them. = Syn. 1. *Rest, Remainder, Remnant, Residue, Balance*. *Rest* is the most general term; it may represent a large or a small part. *Remainder* and *residue* generally represent a comparatively small part, and *remnant* a part not only very small, but of little or no account. *Rest* may be applied to persons as freely as to things; *remainder* and *residue* only to things; but we may speak of the *remainder* of a party. *Remnant* and *residue* are favorite words in the Bible for *rest* or *remainder*, as in Mat. xxii. 6 and Isa. xxi. 17, but such use of them in application to persons is now antique. *Balance* cannot, literally or by legitimate figure, be used for *rest* or *remainder*: we say the *balance* of the time, week, space, party, money. It is a cant word of trade.

Thomson, Castle of Indolence, I. 57.

4. In *line-engraving* and *etching*: (*a*) A distinguishing mark or peculiarity of any kind, indicating any particular state of the plate prior to its completion. The remark may be a slight sketch made by the engraver on the margin of his plate, or it may consist merely in the absence of certain detail or features of the finished work. Thus, in a first proof of an etching the absence of retouching with the dry point, or of a final rebiting, constitutes a remark; or in a line-engraving it may consist in the presence or absence of some minor ob-

ject, or of certain lines representing texture or shading, which in a later state of the plate are removed or added.

The old legend still lingers that the *remarque* began when some unknown etcher tried his point upon the edge of his plate just before taking his first impressions. The belief yet obtains that the *remarque* testifies to the etcher's supreme satisfaction with a supreme effort. But as a matter of fact the *remarque* has become any kind of a fanciful supplementary sketch, not necessarily appropriate, not always done by the etcher, and appearing upon a number of impressions which seem to be limited only at the will of artist or dealer. Sometimes we see 50 *remarque* proofs announced, and again 300.

New York Tribune, Feb. 6, 1887.

(*b*) A print or proof bearing or characterized by a remark; a remarked proof, or remark proof. Also written *remarque*. = *Syn. 2. Remark*, *Observation*, *Comment*, *Commentary*, *Reflection*, *Note*, *Annotation*, *Gloss*. A remark is brief and cursory, suggested by present circumstances and presumably without previous thought. An *observation* is made with some thought and care. A *comment* is a remark or observation bearing closely upon some situation of facts, some previous utterance, or some published work. *Remark* may be substituted by modesty for *observation*. When printed, *remarks*, *observations*, or *comments* may be called *reflections*: as, Burke's "*Reflections on the Revolution in France*"; when they are systematic in explanation of a work, they may be called a *commentary*: as, Lange's "*Commentary on Matthew*." A *note* is primarily a brief writing to help the memory; then a marginal comment: *notes* is sometimes used modestly for *commentary*: as, Barnes's "*Notes on the Psalms*"; Trench's "*Notes on the Parables*." A marginal comment is more definitely expressed by *annotation*. A *gloss* is a comment made for the purpose of explanation, especially upon a word or passage in a foreign language or a peculiar dialect.

renaissance (*rē-nā-sois'* or *re-nā'sans*), *n.* and *a.* [*F. renaissance*, *OF. renaissance*, *renaissance*, < *ML. renascentia*, new birth: see *renaissance*.] 1. *n.* A new birth; hence, the revival of anything which has long been in decay or desuetude. Specifically [*cap.*], the movement of transition in Europe from the medieval to the modern world, and especially the time, spirit, and activity of the revival of classical arts and letters. The earliest traces and most characteristic development of this revival were in Italy, where Petrarch and the early humanists and artists of the fourteenth century may be regarded as its precursors. The movement was greatly stimulated by the influx of Byzantine scholars, who brought the literature of ancient Greece into Italy in the fifteenth century, especially after the taking of Constantinople by the Turks in 1453. The Italian Renaissance was at its height at the end of the fifteenth and in the early sixteenth century, as seen in the lives and works of such men as Lorenzo dei Medici, Michelangelo, Leonardo da Vinci, Raphael, Machiavelli, Politian, Ariosto, Correggio, Titian, and Aldus Manutius. The Renaissance was aided everywhere by the spirit of discovery and exploration of the fifteenth century—the age which saw the invention of printing, the discovery of America, and the rounding of Africa. In Germany the Renaissance advanced about the same time with the Reformation (which commenced in 1517). In England the revival of learning was fostered by Erasmus, Colet, Grocyn, More, and their fellows, about 1500, and in France there was a brilliant artistic and literary development under Louis XII. (1498–1515) and Francis I. (1515–47). Also, in English form, *renaissance*.

I have ventured to give to the foreign word *Renaissance*—destined to become of more common use amongst us as the movement which it denotes comes, as it will come, increasingly to interest us—an English form (*Renaissance*). *M. Arnold, Culture and Anarchy, iv., note.*

The Renaissance and the Reformation mark the return to experience. They showed that the doctrine of reconciliation was at last passing from the abstract to the concrete. *E. Caird, Philos. of Kant, p. 28.*

II. a. [*cap.*] Of or pertaining to the Renaissance; in the style of the Renaissance.—**Renaissance architecture**, the style of building and decoration which succeeded the medieval, and was based upon study and emulation of the outward forms and ornaments of Roman art, though with imperfect understanding of their principles. This style had its origin in Italy in the first half of the fifteenth century, and afterward spread over Europe. Its main characteristic is an attempted return to the classical forms which had been the forerunners of the Byzantine and the medieval. The Florentine Brunelleschi (died about 1446) was one of the first masters of the style, having prepared himself by earnest study of the remains of the monuments of ancient Rome. From Florence the style was introduced into Rome, where the works of Bramante (died 1514) are among its finest examples, the chief of these being the palace of the Chancery, the foundations of St. Peter's, part of the Vatican, and the small church of San Pietro in Montorio. One of the greatest achievements of the Renaissance is the dome of St. Peter's, the work of Michelangelo; but this must yield in grandeur of conception to the earlier Florentine dome of Brunelleschi. After Michelangelo the style declined rapidly. Another chief Renaissance school arose in Venice, where in the majority of the buildings of the sixteenth and seventeenth centuries predominance is given to external decoration. From this school sprang Palladio (1518–1580), whose distinctive style of architecture received the name of *Palladian*. Renaissance architecture was introduced into France by Lombardic and Florentine architects at the beginning of the sixteenth century, and flourished there during that century, but especially in the first half, under Louis XII. and Francis I.

During the seventeenth century the style degenerated in France, as it had in Italy, and gave rise to the inorganic and insipid productions of the so-called *rococo* or Louis XV. style of the first half of the eighteenth century.

Renaissance Architecture.—French Renaissance tomb of Loys de Breze (died 1531), Grand Seneschal of Normandy, etc., in the cathedral of Rouen; erected by his wife, Diane de Poitiers, and attributed to Jean Goujon and Jean Cousin.

In England the Renaissance style was introduced later than in France, and it is represented there by the works of Inigo Jones, Sir Christopher Wren, and their contemporaries—St. Paul's, London, being a grand example by Wren. While all Renaissance architecture is far inferior to medieval building of the best time, it represents a distinct advance over the debased and over-elaborated forms of the medieval decadence. For an Italian example, see cut under *Italian*; see also cuts under *loggia* and *Palladian*.—**Renaissance braid-work**, a kind of needlework similar in its make to needle-point lace, but of much stouter material, as fine braid.—**Renaissance lace**. Same as *Renaissance braid-work*.—**Renaissance painting**, next to architecture the chief art of the Renaissance, had by far its most important and characteristic development in Italy, where, based upon the art of the Byzantine painters of the middle ages, a number of important art-centers or schools arose, differing from one another in their ideals and methods, but all distinctively Italian. The central one of these schools was that of Florence, which took the lead under the impulse and example of the great artist Giotto in the early part of the fourteenth century. Among the greatest of those after Giotto, whose genius influenced the development of the art, were Fra Angelico (Fra Giovanni da Fiesole), Masaccio, Masaccio, Filippo Lippi, Sandro Botticelli, Filippino Lippi, and Leonardo da Vinci. The chief glory of Renaissance painting is that it advanced that art beyond any point that it had attained before, or has since reached. For other schools of Renaissance painting, see *Bolognese*, *Roman*, *Siennese*, *Umbrian*, *Venetian*; and see *Italian painting*, under *Italian*.—**Renaissance sculpture**, the sculpture of the Renaissance, characterized primarily by seeking its models and

of Nicola Pisano, Donatello, Ghiberti, Luca della Robbia, Sansovino, Sangallo, and Michelangelo (1475–1564), one of the half-dozen names that rank as greatest in the world's art-history. See cut of Benvenuto Cellini's "Perseus and Medusa," under *Perseus*, and see, under *quadra*, another example by Luca della Robbia.—**Renaissance style**, properly the style of art and decoration (see *Renaissance architecture*) which prevailed in Italy during the fifteenth century and later, and the styles founded upon these which were in vogue in northern Europe at a date somewhat later—as in France from about 1520 to 1560. By extension the phrase is made to cover all the revived classic styles of the last four centuries, including the above, and to embrace everything which shows a strong classic influence. This use is generally avoided by French writers, who speak of the styles following the religious wars in France as the styles of Henry IV., Louis XIII., etc., excluding these from the Renaissance style proper; but English writers commonly include the whole period from 1400 to the French Revolution or the end of the eighteenth century, and divide it into various epochs or subordinate styles, according to the writer's fancy.

Income; revenue; receipts from any regular source.

2. In *law*: (a) A compensation or return made periodically, or fixed with reference to a period of time, for the possession and use of property of any kind.

(b) Technically, a definite compensation or return reserved by a lease, to be made periodically, or fixed with reference to a period of tenure, and payable in money, produce, or other chattels or labor, for the possession and use of land or buildings. Compensation of any other nature is not termed *rent*, because not enforceable in the same manner. The time of paying rents is either by the particular appointment of the parties in the deed, or by appointment of law, but the law does not control the express appointment of the parties, when such appointment will answer their intention. In England Michachmas and Lady-day are the usual days appointed for payment of rents; and in Scotland Martinmas and Whitsunday.

Take (deer Son) to thee

This Farm's demains, . . .
And th' only *Rent* that of it I reserve is
One Trece fair fruit, to shew thy sute and service.

Sylvestre, tr. of Du Bartas's Weeks, II., Eden.

Rent is said to be due at the first moment of the day appointed for payment, and in arrear at the first moment of the day following.

Encyc. Brit., XIV. 275.

(c) The right to such compensation, particularly in respect of lands. Rents, at common law, are of three kinds: *rent-service, rent-charge* or *fee-farm*

rent, and *rent-sock*. *Rent-service* is when some corporal service is incident to it, as by fealty and a sum of money; *rent-charge*, or *fee-farm rent*, is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear (in other words, it is a charge on lands, etc., in the form of rent, in favor of one who is not the landlord); *rent-sock* is a like rent, but without any clause of distress. There are also *rents of assize*, certain established rents of freeholders and copyholders of manors, which cannot be varied; also called *quit-rents*. These, when payable in silver, are called *white rents*, in contradistinction to rents reserved in work or the baser metals, called *black rents* or *black mail*.

3. In *polit. econ.*, that part of the produce of the soil which is left after deducting what is necessary to the support of the producers (including the wages of the laborers), the interest on the necessary capital, and a supply of seed for the next year; that part of the produce of a given piece of cultivated land which it yields over and above that yielded by the poorest land in cultivation under equal circumstances in respect to transportation, etc. The rent theoretically goes to the owner of the soil, whether cultivator or landlord. Also called *economic rent*.

Rent is that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil. It is often, however, confounded with the interest and profit of capital, and, in popular language, the term is applied to whatever is annually paid by a farmer to his landlord. *Ricardo*, *Pol. Econ.*, ii.

The *rent*, therefore, which any land will yield, is the excess of its produce beyond what would be returned to the same capital if employed on the worst land in cultivation. *J. S. Mill*, *Pol. Econ.*, II. xvi. § 3.

Rent is that portion of the regular net product of a piece of land which remains after deducting the wages of labor and the interest on the capital usual in the country incorporated into it. *W. Roacher*, *Pol. Econ.* (trans.), II. § 149.

No part of Ricardo's theory is more elementary or more unchallenged than this, that the *rent* of land constitutes no part of the price of bread, and that high *rent* is not the cause of dear bread, but dear bread the cause of high *rent*. *Rae*, *Contemporary Socialism*, p. 428.

4. An endowment; revenue.

The kyng hym graunted, and yaf hym *rentes*, and leftte with hym of his anoir grete plemente for to make the hospital, and ther leftte the clerke in this manere, that was after a goode man and holy of lif.

=*Syn.* *Repentance*, *Penitence*, *Contrition*, *Compunction*, *Regret*, *Remorse*, may express the sorrowful feeling of the wrong-doer in view of his conduct. *Regret* is quite as often used of wishing that one had not done that which is unwise; as applied to misconduct, it expresses the feeblest degree of sorrow for doing wrong; but it may contain no element of real *repentance*. *Repentance* goes beyond feeling to express distinct purposes of turning from sin to righteousness; the Bible word most often translated *repentance* means a change of mental and spiritual attitude toward sin. Strictly, *repentance* is the beginning of amendment of life; the word does not imply any greater degree of feeling than is necessary to bring about a change, whether the turning be from a particular sin or from an attitude of sin. *Penitence* implies a large measure of feeling, and applies more exclusively than *repentance* to wrong-doing as an offense against God and right. *Contrition*, literally breaking or bruising, is essentially the same as *penitence*; it is a deep, quiet, and continued sorrow, chiefly for specific acts. *Compunction*, literally pricking, is a sharp pang of regret or self-reproach, often momentary and not always resulting in moral benefit. It is more likely than remorse to result in good. *Remorse*, literally gnawing, is naturally sharper mental suffering than *compunction*; the word often suggests a sort of spiritual despair or hopelessness, paralyzing one for efforts to attain *repentance*.

repentant (rē-pen'tant), *a.* and *n.* [*< ME. repentant*, *< OF. repentant*, repentant, penitent, *< ML. repenitent(t)-s*, ppr. of **repentere*, repent: see *repent*¹.] 1. *a.* 1. Experiencing *repen-*

4. A statement or an assertion made in regard to some matter or circumstance; a verbal description or statement: as, to obtain money by false representations. Specifically — (a) In insurance and law, a verbal or written statement made on the part of the insured to the insurer, before or at the time of the making of the contract, as to the existence of some fact or state of facts tending to induce the insurer more readily to assume the risk, by diminishing the estimate he would otherwise have formed of it. It differs from a warranty and from a condition expressed in the policy, in being part of the preliminary proceedings which propose the contract, and its falsity does not vitiate the contract unless made with fraudulent intent or perhaps with respect to a material point; while the latter are part of the contract when completed, and non-compliance therewith is an express breach which of itself avoids the contract. (b) In Scots law, the written pleading presented to a lord ordinary of the Court of Session when his judgment is brought under review.

5. An expostulatory statement of facts, arguments, or the like; remonstrance.

He threatened "to send his jack-boot to rule the country," when the senate once ventured to make a *representation* against his ruinous policy.

The word *representation* I have restricted to denote, what it only can in propriety express, the immediate object or product of imagination.
Sir W. Hamilton, Logic, vii.

If all reasoning be the *re-representation* of what is now absent but formerly was present and can again be made present — in other words, if the test of accurate reasoning is its reduction to fact — then it is evident that Philosophy, dealing with transcendental objects which cannot be present, and employing a method which admits of no verification (or reduction to the test of fact), must be an impossible attempt.
G. H. Leves.

It is quite evident that the growth of perception involves *representation* of sensations; that the growth of simple reasoning involves *representation* of perceptions; and that the growth of complex reasoning involves *representation* of the results of simple reasoning.

H. Spencer, *Prin. of Psychol.*, § 482.

Assimilation involves retentiveness and differentiation, as we have seen, and prepares the way for *re-representation*; but in itself there is no confronting the new with the old, no determination of likeness, and no subsequent classification.

7. In law: (a) The standing in the place of another, as an heir, or in the right of taking by inheritance; the personating of another, as an heir, executor, or administrator. (b) More specifically, the coming in of children of a deceased heir apparent, devisee dying before the testator, etc., to take the share their parent would have taken had he survived, not as succeeding as the heirs of the parent, but as together representing him among the other heirs of the ancestor. See *representative, n.*, 3. In Scots law the term is usually applied to the obligation incurred by an heir to pay the debts and perform the obligations incumbent upon his predecessor.

8. He [Daniel Gookin] was the originator and the prophet of that immortal dogma of our national greatness—no taxation without representation.

M. C. Tyler, Amer. Lit., I. 154.

As for the principle of representation, that seems to have been an invention of the Teutonic mind; no statesman of antiquity, either in Greece or at Rome, seems to have conceived the idea of a city sending delegates armed with plenary powers to represent its interests in a general legislative assembly.

J. Fiske, Amer. Pol. Ideas, p. 59.

In these small [Grecian] commonwealths representation is unknown; whatever powers may be entrusted to individual magistrates or to smaller councils, the supreme authority must rest with an assembly in which every qualified citizen gives his vote in his own person.

E. A. Freeman, Amer. Lects., p. 246.

9. A representative or delegate, or a number of representatives collectively.

The representations of the people are most obviously susceptible of improvement.

J. Adams, Works, IV. 284.

Proportional representation, representation, as in a political assembly, according to the number of electors, inhabitants, etc., in an electoral district or other unit. This principle is recognized in the United States House of Representatives and in many other bodies, especially those of a popular character.—**Pure representation**. See *pure*.—**Syn.** 3. Show; delineation, portraiture, likeness, resemblance.

representational (rep-rē-zen-tā'shon-əl), *a.* [*< representation + -al.*] Pertaining to or containing representation, in any sense; of the nature of representation.

We find that in "constructive imagination" a new kind of effort is often requisite in order to dissociate these representational complexes as a preliminary to new combinations.

J. Ward, Encyc. Brit., XX. 57.

representational (rep-rē-zen-tā'shon-ā-ri), *a.* [*< representation + -ary.*] Of or pertaining to representation; representative; as, a *representational* system of government. [Rare.] *Imp. Dict.*

representationism (rep-rē-zen-tā'shon-izm), *n.* [*< representation + -ism.*] The doctrine, held by Descartes and others, that in the perception of the external world the immediate object of consciousness is vicarious, or representative of another and principal object beyond the sphere of consciousness.—**Egoistical representationism**. See *egoistic*.

representationist (rep-rē-zen-tā'shon-ist), *n.* [*< representation + -ist.*] One who holds the doctrine of representationism.

The representationists, as denying to consciousness the cognisance of aught beyond a merely subjective phenomenon, are likewise idealists; yet, as positing the reality of an external world, they must be distinguished as cosmthetic idealists.

Hamilton, Reid's Works, Note C, § 1.

representative (rep-rē-zen-tā-tiv), *a.* and *n.* [*< F. représentatif = Pr. representatiu = Sp. Pg. representativo = It. rappresentativo, < ML. representativus, < L. repræsentare, represent; see represent.*] **I. a.** 1. Representing, portraying, or typifying.

Representative [poesy] is as a visible history, and is an image of actions as if they were present, as history is of actions in nature as they are, (that is) past.

Bacon, Advancement of Learning, II.

They relieve themselves with this distinction, and yet own the legal sacrifices, though representative, to be proper and real.

Bp. Atterbury.

Emerson, Representative Men, p. 14.

2. Acting as the substitute for or agent of another or of others; performing the functions of another or of others.

A. Hamilton, Federalist, No. 58.

3. Pertaining to or founded on representation of the people; conducted by the agency of delegates chosen by or representing the people; as, a *representative* government.

A representative government, even when entire, cannot possibly be the seat of sovereignty—the supreme and ultimate power of a State. The very term representative implies a superior in the individual or body represented.

Calhoun, Works, I. 190.

He [Cromwell] gave the country a constitution far more perfect than any which had at that time been known in the world. He reformed the representative system in a manner which has extorted praise even from Lord Clarendon.

Macaulay.

4. In *biol.*: (a) Typical; fully presenting, or alone representing, the characters of a given class or group; as, in zoölogy and botany, the *representative* genus of a family.

Representative cognitions, or those in which consciousness is occupied with the relations among ideas or represented sensations, as in all acts of recollection.

H. Spencer, Prin. of Psychol., § 480.

Representative being, being as an immediate object of consciousness.—**Representative faculty**, the faculty of representing images which the reproductive faculty has evoked; the imagination.—**Representative function**, a function having the properties of $\phi(a, n)$, stated below, under *representative integral*.—**Representative integral**, an integral of the form

$$\int_a^b f_a \cdot \phi(a, n) \cdot da,$$

where f_a is a function of limited variation between A and another limit, B, exceeding b, while $\phi(a, n)$ is (1) such a function of a and the parameter n that the integral of it between the same limits is less than an assignable finite quantity, whatever value between A and B be given to b, and whatever value be given to n; and (2) is such that when n tends toward infinity, the integral of $\phi(a, n)$ from A to b, where b is greater than A and less than B, tends toward a constant finite value. This is called a *representative integral*, because it is equal to the function f_a multiplied by a constant.—**Representative knowledge**, knowledge of a thing by means of a mental image, but not as actually existing.—**Representative primogeniture**. See *primogeniture*.

II. n. 1. One who or that which represents another person or thing; that by which anything is represented or exhibited.

This breadth entitles him [Plato] to stand as the *representative* of philosophy.

Emerson, Representative Men, p. 44.

2. An agent, deputy, or substitute, who supplies the place of another or others, being invested with his or their authority: as, an attorney is the *representative* of his client or employer; specifically, a member of the British House of Commons, or, in the United States, of the lower branch of Congress (the House of Representatives) or of the corresponding branch of the legislature in some States.

Then let us drink the Stewarty,
Kerroughree's laird, and a' that,
Our representative to be.

Burns, Election Ballads, I.

The tribunes of Rome, who were the *representatives* of the people, prevailed, it is well known, in almost every contest with the senate for life.

A. Hamilton, Federalist, No. 63.

There are four essentials to the excellence of a representative system:—That the *representatives* . . . shall be *representatives* rather than mere delegates.

Bryce, Amer. Commonwealth, I. 296.

3. In *law*: (a) One who occupies another's place and succeeds to his beneficial rights in such a way that he may also in some degree be charged with his liabilities. Thus, an heir or devisee, since, to the extent of the property to which he succeeds, he is liable for his ancestor's debts, is a *representative* of the ancestor; but the widow, who takes part of the estate as dower, without liability, is not deemed a *representative* of the deceased; nor is an officer or trustee who succeeds to the rights and powers of the office or trust a *representative* of his predecessor, for, though he comes under liability in respect of the office or trust as his predecessor did, he does not succeed to the liabilities which his predecessor had incurred. The executor or administrator is sometimes spoken of as the *representative* of the decedent, but is usually distinguished by being called the *personal representative*. (b) One who takes under the Statute of Descents or the Statute of Distributions, or under a will or trust deed, a share which by the primary intention would have gone to his parent had the parent survived to the time for taking. If a gift has vested in interest absolutely in the parent, then, upon the parent's death before it vests in possession, the child will take as successor in interest of the parent, but not as *representative* of the parent in this sense. But if the parent dies before acquiring any interest whatever, as where one of several heirs apparent dies before the ancestor, leaving a child or children, the other heirs take their respective shares as if the one had not died, and the child or children of the deceased take the share their deceased parent would have taken. In this case all who share are *representatives* of the ancestor in sense (a), and the child or children are also *representatives* of the deceased heir apparent in sense (b). See *representation*, 7.—**House of Representatives**, the lower branch of the United States Congress, consisting of members chosen biennially by the people. It consists at present (1890) of

about 330 members. In many of the separate States, also, the lower branch of the legislature is called the *House of Representatives*.—**Personal representative**. See *personal*.—**Real representative**, an heir at law or devisee. **representatively** (rep-rē-zen-tā-tiv-ly), *adv.* In a representative manner; as or through a representative.

reproduction (rē-prō-dūk'shon), *n.* [= **F. reproduction = Sp. reproducción = Pg. reproducción = It. riproduzione, < ML. *reproductio(n)-, < *reproducere, reproduce: see reproduce.**] 1. The act or process of reproducing, presenting, or yielding again; repetition.

The labourers and labouring cattle, therefore, employed in agriculture, not only occasion, like the workmen in

manufactures, the reproduction of a value equal to their own consumption, or to the capital which employs them, together with its owners' profits, but of a much greater value.

Adam Smith, *Wealth of Nations*, II. 2.

2. The act or process of restoring parts of an organism that have been destroyed or removed.

The question of the *Reproduction of Lost Parts* is interesting from several points of view in biology.

Mind, IX. 415.

Specifically—3. The process whereby new individuals are generated and the perpetuation of the species is insured; the process whereby new organisms are produced from those already existing: as, the reproduction of plants or animals.

(a) The reproduction of plants is effected either vegetatively or by means of spores or of seeds. Vegetative reproduction consists in the individualizing of some part of the parent organism. In low unicellular plants this is simply a process of fission, one cell dividing into two or more, much as in the formation of tissue, save that the new cells become independent. In higher plants this method obtains by the shooting and rooting of some fraction of the organism, as a branch, a joint of a rootstock, in *Begonia* even a part of a leaf; or through specially modified shoots or buds, as the gemmæ of some algae, mosses, etc., the bulbets of some mosses, ferns, the tiger-lily, etc., the corms, bulbs, and tubers of numerous annual plants. The cells engaged in this mode of reproduction are simply those of the ordinary tissues. Very many, but not all, plants propagate in this manner; but all are capable of reproduction in other methods included under the term *spore-reproduction*, which is reproduction most properly so called. This is accomplished through special reproductive cells, each of which is capable of developing into an individual plant. These are produced either independently, or through the conjunction of two separate cells by which their protoplasm coalesces. These may also in a less perfect sense be called reproductive cells. Reproduction through the union of two cells is sexual; through an independent cell, asexual. Sexual reproduction proceeds either by conjugation (that is, the union of two cells apparently just alike, which may be either common vegetative cells or specialized in form) or by fertilization, in which a smaller but more active sperm-cell or male cell impregnates a larger, less active germ-cell or female cell. In cryptogamous plants both methods are common, and the reproductive cells are termed *spores*, or when of the two sexes *gametes*, the male being distinguished as *antherozoids*, the female as *oospheres*. In flowering plants spore-reproduction is always sexual, fertilization becoming pollination, the embryo-sac in the ovule affording the female cell and the pollen-grain the male cell. But the union of these cells produces, instead of a detachable spore, an embryo or plantlet, which, often accompanied by a store of nutriment, is inclosed within an integument, the whole forming a seed. The production of seeds instead of spores is the most fundamental distinction of phanerogams. Spore-reproduction is consummated by the germination of the spore or seed, which often takes place after a considerable interval. (b) Among the lowest animals, in which no sex is recognizable, reproduction takes place in various ways, which correspond to those above described for the lowest plants. (See *conjugation*, *fission*, *germination*, and *sporulation*.) Among sexed animals, reproduction results from the fecundation of an ovum by spermatozoa, with or without sexual copulation, and with many modifications of the details of the process. (See *genesis*, 2, and words there given.) Many animals are hermaphrodite, containing both sexes in one individual, and maturing the opposite sexual elements either simultaneously or successively: such are self-impregnating or reciprocally fecundating, as the case may be. Reproduction may be effected also by a detached part of an individual, constituting a separate person (see *generative person*, under *generative*). Sexual may alternate with asexual reproduction (see *parthenogenesis*); but in the vast majority of animals, invertebrate as well as vertebrate, permanent and perfect distinction of sex exists, in which cases reproduction always and only results from impregnation of the female by the male in a more or less direct or intimate act of copulation, and extends to but one generation of offspring. The organs or system of organs by which this is effected are known as the *reproductive organs* or *system*. Reproduction is always exactly synonymous with *generation* (def. 1); less precisely with *procreation* and *propagation* in their biological senses. See *sex*.

4. That which is produced or revived; that which is presented anew; a repetition; hence, also, a copy.

Reproductive cells, in bot. See *reproduction*, 3. (a). — **Reproductive faculty**, in the psychology of Sir William Hamilton, the faculty of association of ideas, by virtue of which one suggests a definite other, but not including the faculty of apprehending an idea a second time. — **Reproductive function of order n.** See *function*. — **Reproductive imagination**, the elementary faculty by virtue of which one idea calls up another, of which memory and imagination, as popularly understood, are special developments. See *imagination*, 1.

Philosophers have divided *imagination* into two — what they call the *reproductive* and the *productive*. By the former they mean imagination considered simply as re-exhibition, representing the objects presented by perception — that is, exhibiting them without addition or retrenchment, or any change in the relations which they reciprocally held when first made known to us through sense.

Sir W. Hamilton, *Metaph.*, xxxiii.

Reproductive organs. (a) In bot., the organs appropriated to the production of seeds or spores: in flowering plants, chiefly the stamens and pistils together with the accessory floral envelopes; in cryptogams, mainly the antheridia and archegonia. (b) In zool., those organs or parts of the body, collectively considered, whose function it is to produce and mature ova or spermatozoa or their equivalents, and effect the impregnation of the female by the male elements, or otherwise accomplish reproduction: the reproductive or generative system of any animal in either sex; the genitals, in a broad sense. The fundamental reproductive organ of all sexed animals is an indifferent genital gland, differentiated in the male as a testis, in the female as an ovary (or their respective equivalents); its ulterior modifications are almost endless. These organs are sometimes detached from the main body of the individual (see *person*, 8, and *kelecoctylus*); they often represent both sexes in one individual; they are usually separated in two individuals of opposite sexes; they sometimes fail of functional activity in certain individuals of one sex (see *neuter*, *worker*). — **Reproductive system**, in biol., the sum of the reproductive or generative organs in plants and animals; the generative system; the sexual system of those plants and animals which have distinction of sex. The term is a very broad one, covering not only all parts immediately concerned in generation, but others indirectly conducing to the same end, as devices for effecting fecundation, for protecting or nourishing the product of conception, for cross-fertilization (as of plants by insects), for attracting opposite sexes (as of animals by odorous secretions), and the like. See *secondary sexual characters*, under *sexual*.

The *Reptantia* were divided into *Holochlamyda*, *Pneumochlamyda*, and *Siphonochlamyda*.

The act of creeping or crawling on the belly, as a reptile does. *Owen*.—2. In *math.*, the motion of one plane figure around another, so as constantly to be tangent to the latter while preserving parallelism between different positions of its own lines; especially, such a motion of one figure round another precisely like it so that the longest diameter of one shall come into line with the shortest of the other. This motion was applied by John Bernoulli in 1705 to the rectification of curves. Let AB be a curve whose length is required; let this be reversed about its normal, giving the curve ABC, and let this be reversed about the line between its extremities, giving the spindle-shaped figure ABCD; let DEFG be a similar and equal figure turned through a right angle—then, if the first has a reptatory motion about the second, its center will describe a four-humped or quadriribbous figure OPQRSTU, with humps at P, R, T, V. Let this be placed in contact with a similar and equal figure so that a maximum and minimum diameter shall coincide, and receive a reptatory motion, then its center will describe an octogibbous or eight-humped figure. By a similar process, this will describe a sixteen-humped figure, etc. Each of these figures will have double the periphery of the preceding, and they will rapidly approximate toward circles. Hence, by finding the diameters of each, we approximate to the length of the original curve.

Reptatores (rep-tä-tō-réz), *n. pl.* [NL., < *L. reptare*, pp. *reptatus*, creep, crawl: see *reptant*.] In *ornith.*, in Macgillivray's system of classification, an order of creeping birds, as creepers and nuthatches. [Not in use.]

Specifically—2. An oviparous quadruped; a four-footed egg-laying animal: applied about the middle of the eighteenth century to the animals then technically called *Amphibia*, as frogs, toads, newts, lizards, crocodiles, and turtles; any amphibian.—3. Reptilia (rep-til'i-ä), *n. pl.* [NL., pl. of LL. *reptile*, a reptile: see *reptile*.] In *zool.*: (at) In Linnæus's system of classification (1766), the first order of the third class *Amphibia*, including turtles, lizards, and frogs. See *Amphibia*, 2 (a). [Disused.] (b) A class of cold-blooded oviparous or ovoviviparous vertebrate animals whose skin is covered with scales or scutes; the reptiles proper. There are two pairs or one pair of limbs, or none. The skull is monocondylic. The mandible articulates with the skull by a free or fixed quadrate bone. The heart has two auricles, generally not two completed ventricles; the ventricle gives rise to two arterial trunks, and the venous and arterial circulation are more or less mixed. Respiration is pulmonary, never branchial. No diaphragm is completed. There is a common cloaca of the digestive and urogenital systems, and usually two penes, sometimes one, seldom none. There are an amnion and an allantois. *Reptilia* thus defined were formerly associated with batrachians in a class *Amphibia*; but they are more nearly related to birds, and when brigaded therewith form their part of a superclass *Sauropsida*. The only living representatives of *Reptilia* are turtles or tortoises, crocodiles or alligators, lizards or saurians, and snakes or serpents, respectively constituting the four orders *Chelonía*, *Crocodylia*, *Lacertilia*, and *Ophidia*; and one living lizard, known as *Hatteria*, *Sphenodon*, or *Rhynchocephalus*, forming by itself an order *Rhynchocephalia*. In former times there were other orders of strange and huge reptiles, as the *Ichthyopterygia* or *Ichthyosauria*, the *Ichthyosaurs*, *Anononotia*, *Dinosauria*, by some ranked as a subclass and divided into several orders; *Ornithosauria* or *Pterosauria*, the pterodactyls; and *Plesiosauria* or *Sauropterygia*, the plesiosaurs. republic (rē-pub'lik), *n.* [Early mod. E. also *republick*, *republique* (= D. *republik* = G. *Dan. Sw. republik*; < OF. *republique*, F. *république* = Sp. *república* = Pg. *república* = It. *repubblica*, < L. *res publica*, prop. two words, but commonly written as one, *republica* (abl. *re publicā*, *republicā*), the commonwealth, the state, < *res*, a thing, + *publica*, fem. of *publicus*, public: see *real* and *public*.] 1. The commonwealth; the state.

That by their deeds will make it known

Whose dignity they do sustain;

And life, state, glory, all they gain,

Count the *republic's*, not their own.

B. Jonson, Catiline, ii. (cho.).

2. A commonwealth; a government in which the executive power is vested in a person or persons chosen directly or indirectly by the body of citizens entitled to vote. It is distinguished from a monarchy on the one hand, and generally from a pure democracy on the other. In the latter case the mass of citizens meet and choose the executive, as is still the case in certain Swiss cantons. In a republic the executive is usually chosen indirectly, either by an electoral college as in the United States, or by the National Assembly as in France. Republics are oligarchic, as formerly Venice and Genoa, military, as ancient Rome, strongly centralized, as France, federal, as Switzerland, or, like the United States, may combine a strong central government with large individual powers for the several states in their particular affairs. See *democracy*.

We may define a *republic* to be . . . a government which derives all its powers directly or indirectly from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behaviour.

Madison, The Federalist, No. 39.

But when a king sets himself to bandy against the highest court and *residence* of all his regal power, he then, in the single person of a man, fights against his own majesty and kingship. *Milton.*

4. A remaining or abiding where one's duties lie, or where one's occupation is properly car-

ried on; *eccles.*, the presence of a bishop in his diocese, a canon in his cathedral or collegiate church, or a rector or an incumbent in his benefice; opposed to *non-residence*.

He is ever in his parish; he keepeth *residence* at all times. *Latimer, Sermon of the Plough.*

Residence on the part of the students appears to have been sometimes dispensed with [at the university of Siena]. *Encyc. Brit., XXXIII. 837.*

5. In law: (a) The place where a man's habitation is fixed without any present intention of removing it therefrom; domicile. (b) An established abode, fixed for a considerable time, whether with or without a present intention of ultimate removal. A man cannot fix an intentionally temporary domicile, for the intention that it be temporary makes it in law no domicile, though the abode may be sufficiently fixed to make it in law a residence in this sense. A man may have two residences, but only one can be his domicile. The bankruptcy law uses the term *residence* specifically, as contradistinguished from *domicile*, so as to free cases under it from the difficult and embarrassing presumptions and circumstances upon which the distinctions between *domicile* and *residence* rest. *Residence* is a fact easily ascertained, domicile a question difficult of proof. It is true that the two terms are often used as synonymous, but in law they have distinct meanings. (*Bump.*) See *resident*.

Residence is to be taken in its jural sense, so that a transient absence does not interrupt it.

Woolsey, Intro. to Inter. Law, App. iii., p. 438.

6t. (a) The settling or settlement of liquors; the process of clearing, as by the settling of sediment. (b) That which settles or is deposited, as the thick part of wine that has grown old in bottle.

(c) Any residue or remnant.

When meate is taken quite awaye,

And voyders in presence,

Put you your trenchour in the same,

And all your *residence*.

residewt, *n.* An obsolete form of *residue*.

residual (rē-zīd'ū-əl), *a. and n.* [= *F. résiduel, < NL. *residualis, < L. residuum, residue; see residuum, residue.*] *I. a. 1.* Pertaining to or having the character of a residuum; remaining.—*Residual abscess.* (a) A collection of pus forming in or around the cicatrix of a previous inflammation. (b) A chronic abscess in which the contents have been mostly absorbed.—*Residual air.* See *air1*.—*Residual analysis*, the calculus of differences. This is the old designation, employed by Landen, 1764.—*Residual calculus*,

the calculus of residuals or residues. See II.—**Residual charge**, a charge of electricity spontaneously acquired by coated glass, or any other coated dielectric arranged as a condenser after a discharge, apparently owing to the slow return to the surface of that part of the original charge which had penetrated within the dielectric, as in the Leyden jar. (*Faraday*.) In such cases there is said to be electric absorption. It is doubtless due to the fact that the solid dielectric does not immediately recover from the strain resulting from the electric stress. Also called *dielectric after-working*.—**Residual estate**, residuary estate.—**Residual figure**, in *geom.*, the figure remaining after subtracting a less from a greater.—**Residual magnetism**. See *magnetism*.—**Residual quantity**, in *alg.*, a binomial connected by the sign — (minus): thus, $a - b$, $a - \sqrt{b}$ are residual quantities.

II. n. 1. A remainder; especially, the remainder of an observed quantity, after subtracting so much as can be accounted for in a given way.—2. The integral of a function round a closed contour in the plane of imaginary quantity inclosing a value for which the function becomes infinite, this integral being divided by $2\pi i$. An earlier definition, amounting to the same thing, was the coefficient of x^{-1} in the development of the function a in a sum of two series, one according to ascending, the other according to descending powers of x . If the oval includes only one value for which the function becomes infinite, the residual is said to be taken for or with respect to that value. Also *residue*.

3. A system of points which, together with another system of points of which it is said to be the residual, makes up all the intersections of a given curve with a plane cubic curve.—**Integral residual**, the residual obtained by extending the integration round a contour including several values of the variable for which the function becomes infinite.—**Total residual**, the residual obtained by integrating round a contour including all the values of the variable for which the function becomes infinite. Also called *principal residual*.

residuary (rē-zid'ū-ā-ri), *a.* [= *F. résiduaire*, < *NL. *residuarius*, < *L. residuum*, residue: see *residuum*, *residue*.] Of or pertaining to a residue or residuum; forming a residue, or part not dealt with: as, *residuary estate* (the portion of a testator's estate not devised specially).

It is enough to lose the legacy, or the residuary advantage of the estate left him by the deceased.

Residuary clause, that part of a will which in general language gives whatever may be left after satisfying the other provisions of the will.—**Residuary devisee** or **legatee**, in *law*, the legatee to whom is bequeathed the residue.—**Residuary gum**, the dark residuary matter from the treatment of oils and fats in the manufacture of stearin, used in coating fabrics for the manufacture of roofing.—**Residuary legacy**. See *legacy*.

residuate (rē-zid'ū-āt), *v. t.*; pret. and pp. *residuated*, ppr. *residuating*. [*residu(al) + -ate*.] In *math.*, to find the residual of, in the sense of the quotient of $2\pi i$ into the integral round one or more poles.

residuation (rē-zid'ū-ā'shon), *n.* [*residuate + -ion*.] In *math.*, the act of finding the residual or integral round a pole divided by $2\pi i$; the process of finding residuals and co-residuals upon a cubic curve by linear constructions.—

Sign of residuation, the sign \oint prefixed to the expression of a function to denote the residual. The rules for the use of this sign are not entirely consistent.

residue (rez'ī-dū), *n.* [Early mod. *E.* also *residew*; < *ME. residu*, < *OF. residu*, *F. résidu* = *Sp. Pg. It. residuo*, < *L. residuum*, a remainder, neut. of *residuus*, remaining, < *residere*, remain, reside: see *reside*. Doublet of *residuum*.] 1. That which remains after a part is taken, separated, removed, or dealt with in some other way; what is left over; remainder; the rest.

2. In *law*: (a) The residuum of a testator's estate after payment of debts and legacies. (b) That which remains of a testator's estate after payment of debts and particular legacies, and is undisposed of except it may be by a general clause or residuary legacy.—3. In the theory of numbers, the remainder after division, especially after division by a fixed modulus; in the integral calculus, the integral of a monodromic function taken round a pole or poles: same as *residual*. 2.—**Biquadratic residue**, the same as a *cubic residue*, except that it refers to a fourth power instead of to a cube. Thus, any fourth power of an integer divided by 5 gives as remainder either 0 or 1. These are, therefore, the *biquadratic residues* of 5.—**Cubic residue**, a number which, being added to a multiple of a number of which it is said to be a residue, gives a cube. Thus, every exact cube divided by 7 gives as remainder either 0, 1, or 6. These are, therefore, the *cubic residues* of 7.—**Method of residues**. See *method*.—**Quadratic residue**. See *quadratic*.—**Trigonal residue**, a number which, added to a multiple of another num-

ber of which it is said to be a residue, will give a trigonal number. Thus, 1, 3, 6, 10, 15, 21, 28, are the *trigonal residues* of 13.—**Syn.** 1. *Rest*, etc. See *remainder*.

residuent (rē-zid'ū-ent), *n.* [*residu(um) + -ent*.] In *chemical processes*, a by-product, or waste product, left after the removal or separation of a principal product.

residuons (rē-zid'ū-us), *a.* [*L. residuus*, remaining, residual: see *residue*, *residuum*.] Remaining; residual. *Landor*. [Rare.]

residuum (rē-zid'ū-um), *n.* [*L. residuum*, what remains: see *residue*. Doublet of *residue*.] 1. That which is left after any process; that which remains; a residue.

The metal [copper] is pronounced to be chemically pure, leaving no residuum when dissolved in pure nitric acid. *W. F. Rae, Newfoundland to Manitoba*, vi.

New York Produce Exchange Report (1888-9), p. 279.

2. Specifically, in *law*, that part of an estate which is left after the payment of charges, debts, and particular bequests; more strictly, the part so left which is effectively disposed of by a residuary clause. Sometimes the subject of a particular bequest which proves ineffectual passes by law to the heir or next of kin, instead of falling into the residuum.

resign (rē-zin'), *v.* [*ME. resigenen*, *resynen*, < *OF. resiner*, *resigner*, *F. résigner* (> *G. resignieren* = *Dan. resignere* = *Sw. resignera*) = *Pr. Sp. It. *resina*, < *L. resina*, prob. < Gr. *ρῑνν*, resin (of the pine).] 1. (a) A hardened secretion found in many species of plants, or a substance produced by exposure of the secretion to the air. It is allied to and probably derived from a volatile oil. The typical resins are oxidized hydrocarbons, amorphous, brittle, having a vitreous fracture, insoluble in water, and freely soluble in alcohol, ether, and volatile oils. They unite with alkalis to form soaps. They melt at a low heat, are non-volatile, and burn quickly with a smoky flame. The hardest resins are fossilized like amber and copal, but they show all gradations of hardness through oleoresins and balsams to essential oils. The *hard resins* are nearly odorless, and contain little or no volatile oil; the *soft resins* owe their softness to the volatile oil associated with them. The common resin of commerce exudes in a semi-fluid state from several species of pine (in the United States, chiefly the long-leaved pine). From this the oil of turpentine is separated by distillation. Resins are largely used in the preparation of varnishes, and several are used in medicine. See *gum*. (b) The precipitate formed by treating a tincture with water.

Shak., 2 Hen. IV., ii. 4. 109.

2. The force exerted by a fluid or other medium to retard the motion of a body through it; more generally, any force which always acts in a direction opposite to the residual velocity, or to any component of it: as, *resistance* to shearing. In a phrase like this, *resistance* may be defined as a stress produced by a strain, and tending to restoration of figure. But the resistance is not necessarily elastic—that is, it may cease, and as resistance does cease, when the velocity vanishes. In the older dynamical treatises, resistance is always considered as a function of the velocity, except in the case of friction, which does not vary with the velocity, or at least not much. In modern hydrodynamics the viscosity is taken into account, and produces a kind of resistance partly proportional to the velocity and partly to the acceleration. The theory of resistance still remains imperfect.

Energy, which is force acting, does work in overcoming *Resistance*, which is force acted on and reacting.

G. H. Lewes, Probs. of Life and Mind, II. v. § 5.

3. In *elect.*, that property of a conductor in virtue of which the passage of a current through it is accompanied by a dissipation of energy; the transformation of electric energy into heat. It is one of the two elements upon which the strength of an electric current depends when the flow is steady; the other is electromotive force, and the relation between them is generally expressed by the equation $C = E/R$, which is Ohm's law. *Resistance* may therefore be defined as the ratio of the electromotive force to the current strength ($R = E/C$), the flow being assumed to be steady. For simple periodic alternate currents, the resistance increases as the rapidity of alternation increases, and it also depends on the form of the conductor. Resistance to such currents is sometimes called *impedance* and also *virtual resistance*, that for steady flow being named *ohmic resistance*. In general, resistance is proportional to the length of the conductor and inversely proportional to its cross-section. It also varies with the temperature of the conductor, the nature of the material of which it is composed, the stress to which it is subjected, and in some instances with other physical conditions, as in the case of selenium, the resistance of which diminishes as the intensity of the

light to which it is exposed increases. It is the reciprocal of conductivity. The unit of resistance is the ohm (which see). The designation *resistance* is also applied to coils of wire or other material devices which are introduced into electric circuits on account of the resistance which they offer to the passage of the current. The resistance of a conductor may be measured by Wheatstone's bridge. This is a device for the accurate comparison of electric resistances, invented by Christie and brought into notice by Wheatstone. It consists essentially of a complex circuit of six conductors, arranged as shown in the cut. A current from the battery B enters at the junction of *a* and *c*, and, after dividing into parts depending on the relative resistances of the branches *a*, *b*, *c*, and *d*, returns to the battery through the junction of *b* and *d*. *G* is a galvanometer joined to the junctions *a* and *c* and *b* and *d*. When the relative resistances are such that *a* : *b* :: *c* : *d*, no current will flow through the galvanometer. If *a* and *b* are comparable and adjustable resistances, it is only necessary to establish this condition in order to know the ratio of *c* to *d*. Many modifications of the bridge have been devised.—**Center of resistance.** See *center*.—**Conduction resistance,** the resistance offered by a conductor to an electric current.—**Contact resistance.** See *contact*.—**Curve of elastic resistance.** See *curve*.—**Living resistance,** the work required to produce a sudden strain of a body, especially a sudden elongation of a solid.—**Magnetic resistance,** the reciprocal of magnetic conductivity or permeability. The magnetic flux, or total number of magnetic lines of force passing through a cross-section of any magnetic circuit, may be given in an expression analogous to that giving the strength of an electric current in terms of the electromotive force and resistance. The denominator of the fraction represents the magnetic resistance, sometimes called *magnetic reluctance*.—**Passive resistance,** a friction or similar force opposing the motion of a machine.—**Principle of least resistance,** the principle that when a structure is in equilibrium the passive forces, or stresses occasioned by minute strains, are the least that are capable of balancing the active forces, or those which are independent of the strains.—**Solid of least resistance,** in *mech.*, the solid whose figure is such that in its motion through a fluid it sustains less resistance than any other having the same length and base, or, on the other hand, being stationary in a current of fluid, offers the least interruption to the progress of that fluid. In the former case it has been considered the best form for the stem of a ship; in the latter, the proper form for the pier of a bridge. The problem of finding the solid of least resistance was first proposed and solved by Newton, but only for hypothetical conditions extremely remote from those of nature.—**Specific resistance,** the resistance offered by a conductor of any given material the length of which is one centimeter and the cross-section one square centimeter.—**Transition resistance,** the resistance to an electric current in electrolysis caused by the presence of the ions at the electrodes. = *Syn.* 1. Hindrance, antagonism, check. See *oppose*.

In many wind-instruments, like the flute, and the flue-pipes of an organ, the pitch of the tone is almost wholly determined by the shape and size of the resonant cavity or tube. respiration (res-pi-rā'shon), *n.* [*OF. (and F.) respiration* = *Pr. respiracio* = *Sp. respiracion* = *Pg. respiração* = *It. respirazione*, < *L. respiratio* (n-), breathing, respiration, < *respirare*, pp. *respiratus*, breathe out, respire, take breath: see *respire*.] 1. The act of breathing again or resuming life.

Till the day
Appear of *respiration* to the just,
And vengeance to the wicked.

Milton, P. L., xii. 540.

2. The inspiration and expiration of air.—3. That function by which there takes place an absorption of oxygen from the surrounding medium into the blood with a corresponding excretion of carbon dioxide. This is accomplished in the higher animal forms chiefly by the lungs and skin; the gills or branchiae of aquatic animals and the tracheae of insects perform the same function. In unicellular organisms these changes take place in the protoplasm of the cell itself. The number of respirations in the human adult is from 16 to 24 per minute. About 500 centimeters or one sixth of the volume of the air in the lungs is changed at each respiration, giving a daily income of about 744 grams of oxygen and an expenditure of 900 grams of carbon dioxide. Inspiration is slightly shorter than expiration.

Every breath, by *respiration* strong
Forc'd downward. Couper, Task, iv. 348.

4. In *physiological bot.*, a process consisting in the absorption by plants of oxygen from the air, the oxidation of assimilated products, and the release of carbon dioxide and watery vapor. It is the opposite of *assimilation*, in which carbon dioxide (carbonic acid) is absorbed and oxygen given off—contrasted also as being the waste process in the plant economy, a part of the potential energy of a higher compound being converted into kinetic energy, supporting the activities of the plant, the resulting compound of lower potential being excreted. Respiration takes place in all active cells both by day and by night; assimilation only by daylight (then overshadowing the other process) and in cells containing chlorophyll.

5. The respiratory murmur.—6. A breathing-spell; an interval.

Some meet *respiration* of a more full trial and enquiry into each others' condition.

Bp. Hall, Cases of Conscience, iv. 6.

Abdominal respiration. See *abdominal*.—**Amphoric respiration**, respiratory murmur with musical intonation, such as might be produced by blowing across the mouth of a bottle. It occurs in some cases of pneumothorax and with some phthisical cavities.—**Artificial respiration**, respiration induced by artificial means. It is required in cases of drowning, the excessive inhalation of chlorine or of noxious gases, etc. In the case of a person apparently drowned, or in an asphyxiated condition, the following treatment has been recommended. After clearing the mouth and throat, the patient should be laid on his back on a plane inclined a little from the feet upward; the shoulders gently raised by a firm cushion placed under them; the tongue brought forward so as to project from the side of the mouth, and kept in that position by an elastic band or string tied under the chin. Remove all tight clothing from neck and chest. The arms should then be grasped just above the elbows, raised till they nearly meet above the head, and kept stretched upward for two seconds: this action imitates inspiration. The arms are then turned down and firmly pressed for two seconds against the sides of the chest, thus imitating a deep expiration. These two sets of movements should be perseveringly repeated at the rate of fifteen times in a minute. As soon as a spontaneous effort to breathe is perceived, cease the movements and induce circulation and warmth.—**Branchial respiration.** See *branchial*.—**Branchial**

respiration, respiration such as is heard immediately over bronchus, or over the trachea. The inspiratory sound is high in pitch and tubular; the expiratory sound is higher, tubular, and prolonged. It is heard in disease over consolidated lungs. Also called *tubular respiration*.—**Bronchocavernous respiration**, respiration intermediate in character between bronchial and cavernous respiration.—**Bronchovesicular respiration**, respiration intermediate in character between bronchial and vesicular respiration.—**Cavernous respiration.** See *cavernous*.—**Center of respiration**, the nervous center which regulates respiration. It is automatic in action, but is guided by incoming influences from the vagus, the skin, and elsewhere. The main center is limited in extent, and situated in the floor of the fourth ventricle, near the point of the calamus.—**Cerebral respiration**, shallow, quick, irregular, more or less sighing respiration, sometimes resulting from cerebral disease in children.—**Cheyne-Stokes respiration**, a rhythmic form of respiration described by Cheyne in 1818 and by Stokes in 1846. It consists of a series of cycles in every one of which the respirations pass gradually from feeble and shallow to forcible and deep, and then back to feeble again. A pause follows, and then the next cycle begins with a feeble inspiration. This symptom has been found associated with cardiac and brain lesions.—**Cogged or cog-wheel respiration.** Same as *interrupted respiration*.—**Costal respiration**, respiration in which the costal movements predominate over the diaphragmatic.—**Cutaneous respiration**, gaseous absorption and excretion by the skin.—**Diaphragmatic respiration.** Same as *abdominal respiration* (which see, under *abdominal*).—**Divided respiration**, respiration in which inspiration is separated from expiration by a well-marked interval.—**Facial respiration**, respiratory movements of the face, as of the ale nasi.—**Harsh respiration.** Same as *rude respiration*.—**Indeterminate respiration.** Same as *bronchovesicular respiration*, especially its more vesicular grades.—**Interrupted respiration**, respiration in which the inspiratory, sometimes the expiratory, sound is broken into two or more parts. Also called *jerking, sawy*, and *cogged or cog-wheel respiration*.—**Jerking respiration.** Same as *interrupted respiration*.—**Laryngeal respiration**, laryngeal respiratory movements.—**Metamorphosing respiration**, respiration in which the first part of the inspiratory sound is tubular and the last part cavernous.—**Organs of respiration**, any parts of the body by means of which constituents of the blood are interchanged with those of air or water. In the higher vertebrates, all of which are air-breathers, such organs are internal, and of complex lobulated structure, called *lungs*. (See *lung*.) In lower vertebrates and many invertebrates respiration is effected by breathing water, and such organs are usually called *gills* or *branchiae*. Most invertebrates, however (as nearly all the immense class of insects), breathe air by various contrivances for its admission to the body, generally of tubular or laminated structure, which may open by pores or spiracles on almost any part of the body. The organs of mollusks are extremely variable in form and position; they are commonly called *branchiae* or *gills*, technically *ctenidia*. Some gastropods, called *pulmonate*, are air-breathers. Arachnids are distinguished as *pulmonate* and *tracheate*, according to the laminated (or saccular) or the simply tubular character of their organs of respiration. The character of the lungs as offsets of the alimentary canal is somewhat peculiar to the higher vertebrates—being represented in the lower, as fishes, only by an air-bladder, if at all; and the various organs of respiration of lower animals are only analogous or functionally representative, not homologous or morphologically representative, of such lungs. (See *pneogaster*.) In birds the organs are distributed in most parts of the body, even in the interior of bones. (See *pneumatocyst*.) In embryos the allantois is an organ of respiration, as well as of digestion and circulation. See cuts under *Branchiostoma*, *gill*, and *Mya*.—**Puerile respiration.** See *puerile*.—**Rough respiration.** Same as *rude respiration*.—**Rude respiration**, a form of bronchovesicular respiration, the sounds being harsh.—**Supplementary respiration**, respiration with increased vesicular murmur, as heard over normal parts of the lungs when some other part of them is incapacitated, as from pneumonia or pleurisy.—**Thoracic respiration.** Same as *costal respiration*.—**Tubular respiration.** Same as *branchial respiration*.—**Vesiculocavernous respiration**, respiration intermediate in character between vesicular and cavernous respiration.

It is mostly used to exclude the passage into the lungs of cold air, smoke, dust, and other noxious substances, especially by persons having delicate chests, by firemen, cutlers, grinders, and the like, and by divers in operations under water. Respirators for persons with weak lungs have several plies of fine gauze made of highly heat-conducting metal, which warms the air as it passes through. See *acrophore*.

Tennyson, *Two Voices*.

(b) In *liturgies*: (1) A verse, sentence, phrase, or word said or sung by the choir or congregation in sequence or reply to the priest or officiant. Among the most ancient responses besides the responsories (which see) are *Et cum spiritu tuo* after the Dominus vobiscum, *Habemus ad Dominum* after the Sursum Corda, *Amen*, etc. Sometimes the response is a repetition of something said by the officiant. A verse which has its own response subjoined, the two together often forming one sentence, is called a *versicle*. In liturgical books the signs V and R are often prefixed to the versicle and response respectively. Also (formerly) *responsal*. (2) A versicle or anthem said or sung during or after a lesson; a response or responsory. (c) Reply to an objection in formal disputation. (d) In *music*, same as *answer*, 2 (b).

2. The act of responding or replying; reply: as, to speak in response to a question. — **Consultary response**. See *consultary*.

A *responsibility* to a tribunal at which not only ministers . . . but even nations themselves, must one day answer. *Burke*, *A Regicide Peace*, iii.

A. Hamilton, *The Federalist*, No. 63.

Gen. Jackson was a man of will, and his phrase on one memorable occasion, "I will take the responsibility," is a proverb ever since. *Emerson*, *Fortune of the Republic*.

2. That for which one is responsible or accountable; a trust, duty, or the like: as, heavy responsibilities.

2. Answerable, as for an act performed or for its consequences, or for a trust reposed or a debt; accountable; specifically, in *ethics*, in general, having such a mental or moral character as to be capable of knowing and observing the distinction of right from wrong in conduct, and therefore morally accountable for one's acts; in particular (with reference to a certain act), acting or having acted as a free agent, and with knowledge of the ethical character of the act or of its consequences. With regard to the legal use of the word, two conceptions are often confused — namely, that of the potential condition of being bound to answer or respond in case a wrong should occur, and that of the actual condition of being bound to respond because a wrong has occurred. For the first of these *responsible* is properly used, and for the second *liable*.

With ministers thus *responsible*, "the king could do no wrong." *Sir E. May*, *Const. Hist. Eng.*, i. 1.

In this sense of the word we say that a man is *responsible* for that part of an event which was undetermined when he was left out of account, and which became determined when he was taken account of.

This hook also is called *rest*. A similar hook was sometimes arranged so far at the side, and so projecting, as to receive the lance itself; but this form being inconvenient, the projecting hook was arranged with a hinge. In the justs of the fifteenth and sixteenth centuries the heavy lance was found to require a counterpoise, and the *rest* was made double, the hook projecting sideways, and a long tongue or bar projecting backward under the arm with a sort of spiral twist at the end to prevent the butt of the lance from rising, so that the lance was held firmly, and required from the juster only the exertion of directing its point.

See *relation*.—**Resultant tone**, in *musical acoustics*, a tone produced or generated by the simultaneous sounding of any two somewhat loud and sustained tones. Two varieties are recognized, *differential* and *summational tones*, the former having a vibration-number equal to the difference between the vibration-numbers of the generating tones, and the latter one equal to their sum. It is disputed whether resultant tones, which are often perceptible, have a genuine objective existence, or are merely formed in the ear. Differential tones were first observed by Tartini in 1714, and are often called *Tartini's tones*. The entire subject has been elaborately treated by Helmholtz and recent investigators.

A *result* may proceed from one cause or from the combination of any number of causes. There has been of late a rapid increase in the use of *resultant* in a sense secondary to its physical one—namely, to represent that which is the result of a complex of moral forces, and would be precisely the result of no one of them acting alone.

In theol.: (a) A rising again from the dead. The doctrine of the resurrection has been held in three different forms: (1) As a literal resurrection of the self-same body which has been laid away in the grave: for example, "All the dead shall be raised up with the self-same bodies, and none other, although with different qualities, which shall be united again to their souls forever." *West. Conf. of Faith*, xxxii. 2. (2) As a resurrection from the dead, a coming forth from the place of the departed, but without the body with which the spirit was clothed in life, either with no body or with a new body given for the new life, and one either having no connection with the present earthly body or none that can be now apprehended: for example, "Resurrection of the Body, as taught in the New Testament, is not a Rising again of the same Body, but the Ascend into a higher Body." *J. F. Clarke*, Orthodoxy, its Truths and Errors, xii. § 6. (3) The doctrine of Swedenborg, that every man is possessed of two bodies, a natural and a spiritual, the latter within the former, and that at death the natural body is laid aside and the spiritual body rises at once from the death of the natural, resurrection thus taking place for every one immediately upon and simultaneously with death. Retting is practised upon flax, hemp, jute, and other exogenous fiber-plants. *Deutretting*, effected simply by exposing the material to the weather for a limited time, is largely applied to flax in Russia. *Water-retting*, the ordinary process, consists simply in steeping or macerating the stems in water, commonly in open ponds, sometimes in vats of warm water, the result being more speedily attained by the latter treatment.

Retribution theory, the theory that the condition of the soul after death depends upon a judicial award of rewards and punishments based upon the conduct pursued and the character developed in this life. It is distinguished from the theory that the future life is (a) simply a continuance of the present (continuance theory); (b) a life of gradual development by means of discipline (purgatory), or future redemptive influences (future probation).

On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the soul after death seems comparatively seldom to turn on a judicial system of reward and punishment. Such difference as they make between the future conditions of different classes of souls seems often to belong to a remarkable intermediate doctrine, standing between the earlier continuance theory and the *retribution theory*.

2. That which is revealed, disclosed, or made known; in *theol.*, that disclosure which God makes of himself and of his will to his creatures.

Locke, *Human Understanding*, IV. vii. 2.

More specifically—3. Such disclosure, communicated by supernatural means, of truths which could not be ascertained by natural means; hence, as containing such revelation, the Bible. Divine revelation may be afforded by any one of four media—(a) nature, (b) history, (c) consciousness, or (d) supernatural and direct communications. In theological writings the term, when properly used, signifies exclusively the last form of revelation. *Revelation* differs from *inspiration*, the latter being an exaltation of the natural faculties, the former a communication to or through them of truth not otherwise ascertainable, or at least not otherwise known.

The Revelation of Jesus Christ, which God gave unto him, to shew unto his servants things which must shortly come to pass.

4. In *metaph.*, immediate consciousness of something real and not phenomenal.—**Book of Revelation**, or **The Revelation of St. John the Divine**, the last book of the New Testament, also called the *Apocalypse*. It is generally attributed by the church to the apostle John, and the date of its composition is often put near the end of the first century. There is a wide difference of opinion as to the interpretation and significance of this book. The schools of interpretation are of three principal kinds. The first school, that of the preterists, embraces those who hold that the whole or by far the greater part of the prophecy of this book has been fulfilled; the second is that of the historical interpreters, who hold that the prophecy embraces the whole history of the church and its foes, from the first century to the end of the world; the third view is that of the futurists, who maintain that the prophecy, with perhaps the exception of the first three chapters, relates entirely to events which are to take place at or near to the second coming of the Lord. =**Syn.** 1. *Revenge, Vengeance, Retribution, Retaliation, and Reprisal* agree in expressing the visiting of evil upon others in return for their misdeeds. *Revenge* is the carrying out of a bitter desire to injure an enemy for a wrong done to one's self or to those who seem a part of one's self, and is a purely personal feeling. It generally has reference to one's equals or superiors, and the malignant feeling is all the more bitter when it cannot be gratified. *Vengeance* has an earlier and a later use. In its earlier use it may arise from no personal feeling, but may be visited upon a person for another's wrong as well as for his own. In the Scripture it means retribution with indignation, as in Rom. xii. 19: "Vengeance is mine; I will repay, saith the Lord," where it is a reservation for Jehovah of the offices of distributive and retributive justice. In its later use it involves the idea of wrathful retribution, whether just, unjust, or excessive; it is often a furious revenge: hence there is a general tendency to turn to other words to express just retribution, especially as an act of God. *Retribution* bears more in mind the amount of the wrong done, viewing it as a sort of loan whose equivalent is in some way paid back. Any evil result befalling the perpetrator of a bad deed in consequence of that deed is said to be a *retribution*, whether occurring by human intention or not; personal agency is not prominent in the idea of *retribution*. *Retaliation* combines the notion of equivalent return, which is found in *retribution*, with a distinctly personal agency and intention; sometimes, unlike the preceding words, it has a light sense for good-humored teasing or banter. *Reprisal* is an act of retaliation in war, its essential point being the capture of something in return or as indemnification for pecuniary damage from the other side. The word has also a looser figurative meaning, amounting essentially to retaliation of any sort. See *avenge, requital*, and the definition of *re-torsion*.

reversing-layer (rê-vèrs'-sing-lā'-er), *n.* A hypothetical thin stratum of the solar atmosphere, containing in gaseous form the substances whose presence is shown by the dark lines of the solar spectrum, and supposed to be the seat of the absorption which produces the dark lines. The spectrum of this stratum, if it exists, must be one of bright lines—the negative of the ordinary solar spectrum—and should be seen at the moment when a solar eclipse becomes total. The observation of such a bright-line spectrum, first made by Professor C. A. Young in 1870, and since repeated more or less completely by several eclipse observers, led to the hypothesis. It still remains doubtful, however, whether all the Fraunhofer lines originate in such a thin stratum, or whether different regions of the solar atmosphere cooperate in their formation.

The most usual form of reversing-motion for a locomotive is the link-motion.

Anglo-Catholic revival, Catholic revival, a revival of Catholic or Anglo-Catholic principles and practices in the Church of England (see *Anglo-Catholic*, and *Catholic*, I, 3 (d)), also known, because begun in the University of Oxford, as the *Oxford movement*. It began in 1833, in opposition to an agitation for the expulsion of the bishops from the House of Lords and for the disestablishment of the Church of England. Its founder was H. J. Rose, with whom were joined Arthur Percival, Hurrell Froude, and William Palmer, and, a little later, John Henry Newman (originally an Evangelical) and John Keble, the publication of whose "Christian Year" in 1827 has been regarded as an important precursor of the movement. In its earlier stage the promoters of the revival were known as *Tractarians*. (See *Tractarian*.) After Newman had, in 1845, abandoned the Church of England and joined the Church of Rome, Dr. Edward B. Pusey became generally recognized as the leader of the movement, and its adherents were nicknamed *Puseyites* by their opponents. The revival of

doctrine was the main work of the movement, especially in its earlier stages, but this resulted afterward in a revival of ritual also, and this extension of the movement is known as *ritualism*. (See *ritualist*, 2.) The general object of the Catholic revival was to affirm and enforce the character of the Anglican Church as Catholic in the sense of unbroken historical derivation from and agreement in doctrine and organization with the ancient Catholic Church before the division between East and West.

Specifically—6. A radical change in social or governmental conditions; the overthrow of an established political system, generally accompanied by far-reaching social changes. The term *Revolution*, in English history, is applied distinctively to the convulsion by which James II. was driven from the throne in 1688. In American history it is applied to the war of independence. See below. [In this sense the word is sometimes used adjectively.]

The elections . . . generally fell upon men of revolution principles. *Smollett, Hist. Eng., i. 6.*

The revolution, as it is called, produced no other changes than those which were necessarily caused by the declaration of independence. *Calhoun, Works, i. 189.*

9. The winding or turning of a spiral about its axis, as a spiral of a shell about the columella; one of the coils or whorls thus produced; a volution; a turn.—*American Revolution*, the series of movements by which the thirteen American colonies of Great Britain revolted against the mother country, and asserted and maintained their independence. Hostilities began in 1775, independence was declared in 1776, and the help of France was formally secured in 1778. The war was practically ended by the surrender of the chief British army at Yorktown in 1781, and the independence of the United States was recognized by treaty of peace in 1783.—*Anomalous revolution*. See *anomalistic*.—*English Revolution*, the movements by which James II. was forced to leave England, and a purer constitutional government was secured through the aid of William of Orange, who landed with an Anglo-Dutch army in November, 1688. In 1689 William and Mary were proclaimed constitutional sovereigns, and Parliament passed the Bill of Rights.—*French Revolution*, the series of movements which brought about the downfall of the old absolute monarchy in France, the establishment of the republic, and the abolition of many abuses. The States General assembled in May, 1789, and the Third Estate at once took the lead. The Bastille was stormed by the people, and in the same year the Constituent Assembly overthrew feudal privileges and transferred ecclesiastical property to the state. Abolition of titles and of right of primogeniture, and other reforms, were effected in 1790. The next year a constitution was adopted and the Constituent was succeeded by the Legislative Assembly. In 1792 a coalition of nations was formed against France, the royal family was imprisoned, and in September the Convention replaced the Legislative Assembly and proclaimed the republic. Louis XVI. was executed in 1793, and the Reign of Terror followed in 1793-4; royalist risings were suppressed, and the foreign wars successfully prosecuted. The revolutionary period may be regarded as ending with the establishment of the Directory in 1795, or as extending to the founding of the Consulate in 1799, or even later. Other French revolutions in 1830, 1848, and 1870 resulted respectively in the overthrow of the Bourbon monarchy of the Restoration, of the monarchy of Louis Philippe, and of the Second Empire.—*Pole of revolution*. See *pole*.—*Revolution-indicator*. Same as *operameter*.—*Solid of revolution*, a solid containing all the points traversed by a plane figure in making a revolution round an axis in its plane, and containing no others. ly—(a) A revolving firearm, especially a pistol, having a revolving barrel provided with a number of bores (as in earlier styles of the weapon), or (as in modern forms) a single barrel with a revolving cylinder at its base, provided with a number of chambers. When the barrel or cylinder revolves on its longitudinal axis, the several bores or chambers are brought in succession into relation with firing-mechanism for successive and rapid firing. In the modern forms of the arm the chambers of the cylinder are, by such revolution, brought successively into line with the bore in the barrel, which is also the firing position. In this position each chamber respectively forms a continuation of the bore in the barrel. Six is the common number of chambers. The most vital distinction between early and modern revolving firearms is that the barrels of the former were directly revolved by the hand; while in the latter the revolving-mechanism is connected with the firing-mechanism, the cocking of which automatically revolves the cylinder. Metal cartridges with conical bullets are used in all modern revolvers, the loading being done at the breech. Some are self-cocking—that is, are cocked by pulling the trigger which also discharges them. Some, by peculiar mechanism (though, for general use, they may be cocked in the ordinary way for taking deliberate aim), are by a quick adjustment changed into self-cocking pistols for more rapid firing in emergencies where accurate aim is of subordinate importance. Colonel Colt of the United States was the first to produce a really serviceable and valuable revolving arm, though the principle was known in the earlier part of the sixteenth century. (b) A revolving cannon.—3. A revolving horse-rake.

The heat is supplied by a Siemens regenerative gas-furnace, or by a coal-furnace, and the hot flame circulates longitudinally through the cylinder into a smoke-stack or chimney. The charging is done through a hole in the side of the cylinder, and the crude soda, rolled into balls by the motion of the cylinder, is discharged through the same opening.—**Revolving pistol.** Same as *revolver*.—**Revolving press.** See *press*.—**Revolving storm,** a cyclone.

They may be entirely within these cells, or protrude from them, are readily pressed out, and often found in abundance in the mucus secreted and deposited by the worms. The function of the rhabdites seems related to the tactile sense. They vary in size and form, and also in their local or general dispersion on the body of the worm. They are produced in the ordinary epidermic cells, or in special formative cells beneath the integument, whence they work their way to the surface. Some similar bodies, of granular instead of homogeneous structure, are distinguished as *pseudo-rhabdites*. See *sagittocytes*.

Worms of this form develop from the embryo in damp earth, where they lead an independent life till they migrate into their host, where, after further transformations, they acquire the sexually mature condition, though this is sometimes attained while they are still free. Members of the genera *Leptodera*, *Pelodera*, *Rhabdonema*, and others have been referred to *Rhabditis* under various specific names.—**Rhabditis genitalis**, a small round worm which has been found in the urine.

Rhabdocela (rab-dō-sē'li), *n. pl.* [NL., *< Gr. ῥάβδος*, a rod, + *κοίλος*, hollow.] A prime division of turbellarian worms, forming a suborder of *Turbellaria*, contrasted with *Dendroeca* (which see), containing small forms whose intestine, when present, is straight and simple. The body is cylindric (as compared with other flatworms), but more or less flattened; the sexual organs are usually hermaphrodite; there is no anus (see *Aprocta*), but a mouth, the position of which varies extremely in different genera, and usually a protrusile pharynx or buccal proboscis. In most forms the alimentary canal is distinct; in others (see *Acoela*) it is not fairly differentiated from the general digestive parenchyma. There are numerous forms of this group, mostly inhabiting fresh water, though some are marine. They live on the juices of small worms, crustaceans, and insects, which they suck after enveloping their prey in a sort of mucus secreted by the skin and containing rhabdites. (See *rhabdite*, 2.) The group is divided, mainly upon the character of the intestine, into three sections: (1) *Acoela*, without differentiated intestine, represented by the family *Convolutidae*; (2) *Rhabdocela* proper, with definite intestinal tract, a nervous system and excretory organs present, compact male and female generative glands, complicated pharynx, and generally no otoliths—embracing numerous forms of several different families, both of fresh and salt water; (3) *Alloacoela*, resembling (2), but with otoliths, represented by one family, *Monotidae*. Another division, based mainly upon the position or other character of the mouth, is directly into a number of families, as *Convolutidae*, *Opisthomidae*, *Derostomatidae*, *Mesostomatidae*, *Prostomatidae*, and *Microstomatidae*. Also called *Rhabdocelida*.

The 13 species are all Australian. They are shrubs or rarely herbs, either slender or robust, mealy or minutely woolly, bearing chiefly alternate leaves and small greenish flowers which are spiked or panicle, and are followed by globose or flattened berries, often red. General names for the species are *red-berry* and *seaberry*. *R. rhagon (rag'on), *n.* [NL., < Gr. *páz* (*pay-*), a grape.] A type of sponge-structure resulting from the modification of a primitive form, as an olynthus, by the outgrowth of the endoderm into a number of approximately spherical chambers communicating with the exterior by a prosopyle and with the paragastric cavity by an apopyle (see *prosopyle*), with conversion of the flagellated into pavement epithelium except in the chambers. The rhagon occurs as a stage in the early development of some sponges, and others exhibit it in the adult state. The structure is named from the grape-like form of the spherical chambers. The term is correlated with *aseon*, *leucon*, and *sycon*. Also called *dysyscus*.

This may be termed the aphodal or racemose type of the *Rhagon* system, since the chambers at the ends of the aphodi radiating from the excurrent canal look like grapes on a bunch. *W. J. Sollas*, *Encyc. Brit.*, XXII. 415.

Rhamnaceae (ram-nā'sē-ē), *n. pl.* [NL. (Lindley, 1835), < *Rhamnus* + *-aceae*.] An order of polypetalous plants of the series *Disciflorae*. It is unlike the rest of its cohort *Celastrales* in its valvate calyx-lobes, and resembles the related *Amelidaceae*, or grape family, in its superior ovary and the position of its stamens opposite the petals; it is distinguished by its habit, strongly perigynous stamens, concave petals which are not caducous, larger and valvate sepals, and fruit not a berry. It includes about 475 species, classed in 5 tribes and 42 genera, widely diffused through warm countries. They are commonly erect trees or shrubs, often thorny, bearing undivided alternate or opposite stipulate leaves, which are often coriaceous and three- to five-nerved. The small flowers are greenish or yellow, commonly in axillary cymes, which are followed by three-celled capsules or drupes, sometimes edible, sometimes hard and indehiscent. It is often called the *buckthorn family*, from the common name of *Rhamnus*, the type genus. See cut under *Rhamnus*.

P. de Candolle, 1825), < *Rhamnus* + *-æ*.] The principal tribe of the order *Rhamnaceae*, characterized by a dry or drupaceous fruit containing three stones which are indehiscent or two-valved. Although this name was originally employed for the order, it is better to restrict it to the tribe, and adopt the later form *Rhamnaceae* of Lindley for the ordinal term, as is very generally done. See *Rhamnus*, *Ceanothus*, *Sageretia*, and *Pomaderris* for the chief among its 21 genera.

Rhamnus (ram'nus), *n.* [NL. (Tournefort, 1700), < *L. rhamnos*, < *Gr. ῥάμνος*, the buckthorn, Christ's-thorn.] A genus of polypetalous shrubs and trees, including the buckthorn, type of the order *Rhamnaceae* and of the tribe *Rhamnæ*. It is characterized by a thin disk sheathing the bell-shaped calyx-tube and bearing the four or five stamens on its margin; by a free ovary often immersed within the disk; and by its fruit, an oblong or spherical drupe, surrounded at its base by the small calyx-tube, and containing two, three, or four hard one-seeded stones. There are about 66 species, natives of warm and temperate regions, frequent in Europe, Asia, and America, rare in the tropics. They bear alternate petioled and feather-veined leaves, which are either entire or toothed, deciduous or evergreen, and are furnished with small deciduous stipules. The flowers are in axillary racemes or cymes, and are commonly dioecious in the typical section, but not so in the principal American species (the genus *Frangula* of Brongniart), which also differ in their unfurrowed seeds and flat fleshy seed-leaves. A general name for the species is *buckthorn*, the common buckthorn being *R. cathartica* of the northern Old World, planted and sparingly nat-

uralized in the United States. It is used as a hedge-plant. Its bark is medicinal, like that of *R. Frangula*; its black berries afford a now nearly disused cathartic, and with

those of some other species yield by treatment the pigment known as *sap-green*. *R. Frangula*, of the same nativity, called *black or berry-bearing alder*, *alder-buckthorn*, and (*black*) *dogwood*, affords one of the very best gunpowder-charcoals, while its bark is an official cathartic. (See *Frangula*, *frangulin*.) The fruit of *R. infectiorius* and other species forms the French, Turkey, or Persian berries of the dyers. (See under *Pernian*.) In China the bark of *R. tinctorius* (*R. chlorophorus*) and *R. Davuricus* (*R. utilis*) affords the famous green indigo, or *lokao*, there used to dye silks, also introduced at Lyons. (For other Old World species, see *alaternus* and *lotus-tree*, 3.) *R. Carolinianus* of the southern United States is a shrub or small tree, bearing a sweet and agreeable fruit. The berries of *R. croceus* of California are much eaten by the Indians. *R. Californicus*, the California coffee-tree, yields an unimportant coffee-substitute. *R. Purshianus* of the western coast yields the cascara sagrada bark (see under *bark*), sometimes called *chittam-bark*, whence probably, in view of the hard fine wood, the name *shittim-wood*. See *bearberry*, 2, and *redwood*, 2.

The *rhapsodist* did not, like the early minstrel, use the accompaniment of the harp; he gave the verses in a flowing recitative, bearing in his hand a branch of laurel, the symbol of Apollo's inspiration. Encyc. Brit., XI. 137.

2. One who recites or sings verses for a livelihood; one who makes and recites verses extempore.

As to the origin of this [harvest] song — whether it came in its actual state from the brain of a single *rhapsodist*, or was gradually perfected by a school or succession of *rhapsodists* — I am ignorant. George Eliot, *Adam Bede*, liii.

3. One who speaks or writes with exaggerated sentiment or expression; one who expresses himself with more enthusiasm than accuracy or logical connection of ideas.

Let me ask our *rhapsodist*, — "if you have nothing . . . but the beauty and excellency and loveliness of virtue to preach . . . and . . . no future rewards or punishments . . . how many . . . vicious wretches will you ever reclaim?" Watts, *Improvement of Mind*, I. x. § 11.

There were various methods of practising this *rhapsodomancy*. Sometimes they wrote several verses or sentences of a poet on so many pieces of wood, paper, or the like, shook them together in an urn, and drew out one . . . Sometimes they cast dice on a table on which verses were written, and that on which the die lodged contained the prediction. A third manner was by opening a book, and pitching on some verse at first sight. This method they particularly called the *Sortes Prænestinae*, and afterwards, according to the poet thus made use of, *Sortes Homericae*, *Sortes Virgilianæ*, &c. Rees, *Cyclopædia*.

The art of discourse; the art of using language so as to influence others. Rhetoric is that art which consists in a systematic use of the technical means of influencing the minds, imaginations, emotions, and actions of others by the use of language. Primarily, it is the art of oratory, with inclusion of both composition and delivery; secondarily, it also includes written composition and recitation. It is also used in narrower senses, so as to present the idea of composition alone, or the idea of oratorical delivery (elocution) alone. Etymologically, rhetoric is the art, or rather the technics (*τέχνη*), somewhat different in scope from our art, of the rhetor—that is, either the popular (political) orator or the judicial and professional rhetor. Accordingly, ancient writers regarded it mainly as the art of persuasion, and something of this view almost always attaches to the word even in modern use, so that it appears to be more or less inappropriate to use *rhetoric* of mere scientific, didactic, or expository composition. The element of persuasion, or at least of influence of thought, belongs, however, to such composition also in so far as accurate and well-arranged statement of views leads to their adoption or rejection, the very object of instruction involving this. On the other hand, poetry and epideictic oratory chiefly address the imagination and emotions, while the most important branches of oratory (deliberative and judicial oratory) appeal especially to the mind and emotions with a view to influencing immediate action. The theory or science underlying the art of rhetoric, and sometimes called by the same name, is essentially a creation of the ancient Greeks. Rhetoric was cultivated on its more practical side first of all by the earlier rhetors (so-called "sophists") and orators (Empedocles—considered the inventor of rhetoric—Gorgias, Isocrates, etc.), many of whom wrote practical treatises (*τέχνη*) on the art. The philosophers, on the other hand, among them Aristotle, treated the subject from the theoretical side. The system of rhetoric which finally became established, and has never been superseded, though largely mutilated and misunderstood in medieval and modern times, is that founded upon the system of the Stoic philosophers by the practical rhetorician Hermagoras (about 60 B. C.). Its most important extant representatives are Hermogenes (about A. D. 165) among the Greeks, and Quintilian (about A. D. 95) among the Latins. This theory recognizes three great divisions of oratory. (See *oratory*.) The art of rhetoric was divided into five parts: invention, disposition, elocution (not in the modern sense, but comprising diction and style), memory (mnemonics), and action (delivery, including the modern elocution).

The word is used with a certain and unfortunate freedom in application to joint pains of various origins and anatomical forms. — **Acute articular rheumatism**, an acute febrile disease, with pain and inflammation of the joints as the prominent symptom. It is to be separated as of distinct, possibly bacterial, origin from joint affections caused by gout, plumbism, scarlatina, gonorrhea, septicemia, tuberculosis, or syphilis. It often begins suddenly; a number of joints are usually attacked one after the other; the fever is irregular; there is apt to be profuse sweating; endocarditis, pericarditis, pleuritis, sudamina, erythema nodosum, hyperpyrexia, and delirium are more or less frequent features of the cases. Its duration is from one to six weeks or more. It is most frequent between 15 and 35, but may occur in the first year of life or after 50. One attack does not protect, but, as in pneumonia and erysipelas, is often succeeded by others. It almost always issues in recovery, but frequently leaves permanent cardiac lesions. Also called *acute rheumatism*, *rheumathritis*, *rheumatic fever*, *acute rheumatic polyarthritis*. — **Chronic articular rheumatism**, the result, commonly, of one or more attacks of acute rheumatism, characterized by a chronic inflammation of one or more joints without profound structural alteration. — **Gonorrheal rheumatism**, an inflammation of the joints occurring in persons having gonorrhea. — **Muscular rheumatism**, a painful disorder of the muscles, characterized by local pain, especially on use of the muscles affected: same as *myalgia*. — **Progressive chronic articular rheumatism**. A genus of polypetalous plants of the order *Melastomaceae*, type of the tribe *Rhexieae*. It is characterized by the four obovate petals, the smooth ovary, and the eight equal anthers with a thickened or spurred connective, each anther long and slender, incurved, and opening by a single terminal pore. The 7 species are natives of North America, and are the only members of their large family which pass beyond the tropics, except the 2 species of *Bradia* in eastern Asia. Three or four species extend to the Middle Atlantic States, and one is found in New England. They are herbs or erect undershrubs, branched and usually set with conspicuous, dark, gland-bearing bristles. Their leaves are oblong, short-petioled, three-nerved, entire or bristle-toothed, the flowers solitary or cymose, commonly of a purplish-red color with yellow stamens, and very pretty.

elongated corolla-tube, with a linear and recurved upper lip, the lower broad, flat, and spreading. The 4 species are natives of tropical and southern Africa, India, and the Moluccas. They are next allied to *Dianthera*, the water-willow of the United States, but are readily distinguished by their inflorescence and shrubby habit. They bear entire leaves, and small axillary clusters of flowers which often form a large loose-branched panicle or dense terminal thyrus of crowded cymes. *R. communis* is a slender shrub, whose root and leaves are used in India and China as an application for ringworm and other cutaneous diseases, whence called *ringworm-root*.

The 2 or 3 very variable species are natives of temperate and northern regions in Europe, Asia, and America. They are annual erect herbs, more or less parasitic on the roots of grasses. They bear opposite cre-nate leaves, and yellow, violet, or bluish flowers sessile in the axils of deep-cut floral leaves, the upper flowers condensed into a spike. *R. rhinencephalon (ri-nen-sef'ä-lon), *n.*; pl. *rhinencephala* (-lä). [NL., < Gr. *ῥίς* (ῥιν-), nose, + *ἐγκέφαλος*, brain: see *encephalon*.] The olfactory lobe of the brain; the foremost one of the several morphological segments of the encephalon, preceding the prosencephalon. In the lower vertebrates the rhinencephalon is relatively large, and evidently a distinct part of the brain. In the higher it gradually diminishes in size, becoming relatively very small, and apparently a mere outgrowth of the cerebrum. Thus, in man the rhinencephalon is reduced to the so-called pair of olfactory nerves, from their roots in the cerebrum to the olfactory bulbs whence are given off the numerous filaments, the proper olfactory nerves,

which pierce the cribriform plate of the ethmoid, and ramify in the nose. The rhinencephalon, like other encephalic segments, is paired or double—that is, consists of right and left halves. It is primitively hollow, or has its proper ventricle, which, however, is entirely obliterated in the adults of the higher vertebrates. This hollow is a prolongation of the system of cavities common to the other encephalic segments, and known as the *rhinocoel*. Also *rhinencephal*. See *cist* under *Petromyzontidae*, *Rana*, *brain* (cut 2), and *encephalon*.

A large pachydermatous perissodactyl mammal with a horn on the nose; any member of the genus *Rhinoceros* or family *Rhinocerotidae*. There are several living as well as many fossil species. They are huge ungainly quadrupeds, having an extremely thick and tough or hard skin, thrown into various buckler-like plates and folds. The legs are short, stout, and clumsy, with odd-toed feet, whose three digits are incased in separate hoofs. The tail is short; the ears are high and rather large; the head is very large and unshapely, supported upon a thick stocky neck; the muzzle is blunt, and the upper lip freely movable. The head is especially long in the nasal region, and there are usually one or two massive upright horns, without any bony core, the substance of the horn being epidermal only. When two horns are present they are one behind the other in the median line, and the hinder one rests over the frontal bone, the front one being in any case borne upon the nasal bones. Rhinoceroses live mainly in marshy places, in thick or rank vegetation, and subsist entirely upon vegetable food. The living species are now confined to the warmer parts of Africa and Asia, and are hairless or nearly so; but these animals formerly had a much more extensive range, not only in the Old World, but also in America. The best-known of the extinct species is *R. tichorhinus*, the woolly rhinoceros, which formerly ranged over Europe, including the British Isles. Of the existing one-horned

One-horned Rhinoceros (*Rhinoceros unicornis*).

species are the Indian rhinoceros, *R. indicus* or *R. unicornis*, which inhabits the warmer parts of Asia, attains a height of 5 feet, and has the horn short and stout; the Javan rhinoceros, *R. sondaicus*, or *R. javanus*, distinct from the Indian species, inhabiting Java, the Malay peninsula, etc.; the hairy-eared rhinoceros, *R. lasiotis*; and the African kobaoba, *R. simus*. The two-horned species include the Sumatran or Malaccan rhinoceros, *R. sumatrensis*; and the African keltloa, *R. keltloa* or *bicornis*. See also cut under *Perissodactyla*.

The common rhinoceros-beetle of the United States, *Dynastes tityus*, the largest of the North American beetles, has two large horns directed forward, one arising from the thorax and one from the head, in the male beetle only. The general color is greenish-gray with black markings, and between this form and a uniform brown there are many gradations. The larva feeds in decaying stumps and logs. Both beetle and larva have a peculiarly disagreeable odor, which, when they are present in any number, becomes insupportable. *D. hercules* of South America is another rhinoceros-beetle, specifically called the *Hercules-beetle*, whose prothoracic horn is immensely long. See also cut under *Hercules-beetle*.

Most of the species are epiphytes, pendent from the branches of trees, often for many feet; whence sometimes called *mistletoe-cactus*, some species also having white berries. Also called *willow-cactus*, in conformity with the genus name. In cultivation they are reared in pots and baskets.

In some plants rhizomania is an indication that there is some defect in the true root, in consequence of which it cannot supply sufficient nourishment to the plant. In such cases rhizomania is an effort of nature to supply the deficiency. This is the case in common laurel, in which plant rhizomania generally forebodes death. The phenomenon is also frequently seen in apple-trees, from the stems of which bundles of roots are sent out; these, absorbing moisture and finally decaying, are a cause of canker on the tree.

(Linnaeus, 1737), named with ref. to the aerial roots; neut. pl. of *rhizophorus*: see *rhizophorus*.] A genus of polypetalous trees, the mangroves, type of the order *Rhizophoraceæ*, and of the tribe *Rhizophorææ*. It is characterized by a four-parted calyx, surrounded with a cupule or involucre of partly united bractlets, by its four petals and eight to twelve elongated and nearly sessile anthers, which are at first many-celled, and by a partly inferior ovary which is prolonged above into a fleshy cone and bears two pendulous ovules in each of its two cells. There are 2 (or, as some regard them, 5) species, frequent on muddy or coral shores in the tropics, there forming dense and almost impassable jungles known as mangrove-swamps. They are trees with thick cylindrical and scarred branchlets, bearing opposite thick and smooth coriaceous leaves, which are ovate or elliptical and entire. Their large rigid flowers are borne in axillary clusters, followed by a nut-like one-seeded fruit. The seed is remarkable for germinating while yet in the long-persistent fruit. It contains a large embryo with a very long club-shaped radicle, which soon pierces the point of the hard pericarp and lengthens till it reaches the mud, or becomes a foot long before falling. The mangrove is also remarkable for spreading by aerial roots. The ordinary species is *R. mucronata*, which reaches to semitropical Florida, the delta of the Mississippi, and Texas. See *mangrove*, 1.

It includes about 50 species in 17 genera and 3 tribes, all tropical, and most of them forming dense and malarious jungles about river-mouths and along shores. They are usually extremely smooth, with round and nodose branchlets, and opposite thick and rigid leaves, which are commonly entire and have elongated and very caducous intrapetiolar stipules. They bear axillary cymes, panicles, spikes, or racemes of rather inconspicuous flowers.

Dicksonii* is parasitic on species of *Ectocarpus*.

rhizopod (ri-zō-pod), *a. and n.* [*< NL. rhizopod* (-pod-) (as a noun, in def. 2. *rhizopodium*), < Gr. *ρίζα*, root, + *πός* (πόδ-) = E. *foot*.] *I. a.* Provided with pseudopods, as an animalcule; having processes of sarcode, as if roots, by means of which the animalcule is attached or moves; root-footed; specifically, of or pertaining to the *Rhizopoda*, in any sense. Also *rhizopodous*.

Rhizopoda (ri-zōp'ō-dā), *n. pl.* [NL.: see *rhizopod*.] *1.* In Dujardin's system of classification (1841), the third family of "diversiform infusorians without visible locomotory appendages" — that is, without permanent appendages, as cilia or flagella. This is the original meaning of the word, since much extended. Dujardin included in his *Rhizopoda* the 8 genera *Arcella*, *Difflugia*, *Trinema*, *Euglypha*, *Gromia*, *Miliola*, *Cristellaria*, and *Vorticella*.

2. The lowest class of *Protozoa*, composed of simple or multiple animalcules without definite or permanent distinction of external parts, and provided with diversiform temporary or permanent pseudopodial prolongations of the body-substance, by means of which locomotion, fixation, and ingestion are effected. There is no mouth or special ingestive area; the sarcode may be distinguishable into an outer ectoplasm and an inner endoplasm; a nucleus and nucleolus (endoplast and endoplastule) may be present; and most of these animalcules secrete a shell or test, often of great beauty and complexity. The rhizopods are minute, usually microscopic organisms, some or other forms of which abound in both salt and fresh waters. The characteristic pseudopodia are highly diverse in form, and constantly change, but occur in two principal forms, coarse lobate or digitate processes and fine slender rays, both of which may run together or interlace. The valuation and limitation of the *Rhizopoda* have varied with different authors. A normal amoeboid protozoan is a characteristic example of this class. Other forms included under *Rhizopoda* are the so-called moners of the order *Monera*; the *Foraminifera*, with a calcareous shell; and the *Radiolaria*, with a silicious shell. By common consent the sponges, which have been classed with *Rhizopoda*, are now excluded, even by those who still consider these organisms as protozoans. See cuts under *Amæba*, *Foraminifera*, and *Radiolaria*.

tists of this school sought their inspiration in the works of Lysippus. The intensity of expression attained in the Laocöon has never been surpassed, and its exaggerations are redeemed by its real power. It is characterized by a broad, spreading, and oblique corolla, usually with five imbricating lobes; eight to ten stamens, the anthers opening by pores; and a five- to twenty-celled ovary with numerous ovules in many crowded rows, the seeds appendaged. There are about 170 species, natives of the mountains of Europe, Asia, the Malay Archipelago, and North America, most abundant in the Himalayas. They are commonly shrubs, less often trees, smooth, hairy, woolly, or scurfy, and often with whorled branches. They bear alternate entire leaves, most often crowded at the ends of the branches. Their handsome flowers are commonly borne in corymba, and have conspicuous, more or less unequal, long, slender, and curving stamens, with long hairs clothing their base.

Rhododendron grande (Himalayas).

The fruit is a woody pod, splitting septically from the apex into valves, and filled with seeds like fine sawdust, each containing a cylindrical embryo and fleshy albumen. Most of the species, and all of those best known, produce their new growths below the flowers, which form a terminal inflorescence destitute of leaves, and developed from a large scaly bud. The leaves in the typical species, forming the section *Rhododendron* proper, are evergreen and coriaceous; but they are deciduous in the sections *Azalea* and *Trutnea*, which include the American species commonly known as *azaleas*, and produce leaves closely encircling the flowers, or, in *Trutnea*, mixed with them. The flowers, nearly or quite 2 inches across, often reach in *R. Aucklandiæ* a breadth of 6 inches. See *pinkster-flower*.

2. [l. c.] Any one of the many species of the above genus, belonging to the section *Rhododendron*; the rose-bay. The rhododendrons are handsome shrubs, much cultivated for their evergreen leathery leaves and profusion of beautifully formed and colored flowers. The ordinary species of American outdoor plantations is *R. Catawbiense*, the Catawba or Carolina rhododendron, hybridized with the more tender exotics *R. Ponticum* and *R. arboreum*. The Catawba species grows from 3 to 6, rarely 20, feet high, has oval or oblong leaves and broadly bell-shaped lilac-purple or (in culture) variously colored flowers. It is native in the Alleghenies from Virginia southward. It has also been largely cultivated in Europe, and there are hundreds of varieties. The great rhododendron (or laurel), *R. maximum*, abounds in the Al-

Flowering Branch of the Great Laurel (*Rhododendron maximum*).

leghenies, and is found as far north as Maine and Canada. It is commonly taller than *R. Catawbiense*, with narrower leaves, and flowers pink or nearly white with a greenish throat. It is a fine species, but much less cultivated than the last; it affords some hybrids. The Californian rhododendron, *R. Californicum*, resembles the Catawba rhododendron, but has more showy flowers. It deserves cultivation, and has proved hardy in England. The Pontic rhododendron, *R. Ponticum*, is the most common species of European gardens, hardly only as a low shrub in the northern United States. *R. arboreum*, the tree rhododendron, is a fine Himalayan species, 25 feet high, with the leaves silvery-white beneath, and the flowers scarlet varying to white. The Lapland rhododendron, *R. Lapponicum*, is a dwarf arctic and alpine species of both hemispheres, growing prostrate in broad tufts. The Siberian or Dahurian rhododendron, *R. Dauricum*, a dwarf species, somewhat cultivated, bears its bright rose-purple flowers on naked shoots in early spring.—**Indian rhododendron.** See *Melastoma*.

rhubarb (rō'bärb), *n.* and *a.* [Early mod E. also *rheubarb*, *reubarbe*, *rubarbe*, *reubarbe*; < OF. *rubarbe*, *reobarbe*, *rheubarbe*, *reubarbare*, F. *rubarbe* = Pr. *reubarba* = Cat. *riubarbarro* = Sp. *ruibarbo* = Pg. *reubarbo*, *ruibarbo* = It. *reobarbaro*, *rabarbaro*, formerly *rabbarbaro* = D. *rabarber* = G. *rhabarber* = Dan. Sw. *rabarber* (Turk. *rubās*), < ML. *rheubarbarum*, *rhubarbarum*, also *reubarbarum*, for *rheum barbarum*, < Gr. *ῥῆον βάραρον*, *rhubarb*, *ῥῆον*, *rhubarb* (*ῥῆον*, ML. *rheum*, being appar. a deriv. or orig. an adj. form of 'Pa, the Rha, or Volga river, whence *rhubarb* was also called *rha Ponticum*, 'Pontic rha' (see *rhapontic*), and *rha barbarum*, 'barbarous (i. e. foreign) rha': see *rha*, *Rheum*², and *barbarous*.] 1. *n.* 1. The general name for plants of the genus *Rheum*, especially for species affording the drug *rhubarb* and the culinary herb of that name. The specific source of the official *rhubarb* is still partially in question; but it is practically

Medicinal Rhubarb (*Rheum officinale*).

settled that *R. officinale* is one of the probably several species which yield it. *R. palmatum*, *R. Franzbachii*, and *R. hybridum* also have some claims. The article is produced on the high table-lands of western China and eastern Tibet, and formerly reached the western market by the way of Russia and Turkey, being named accordingly. It is now obtained from China by sea (Chinese *rhubarb*), but is more mixed in quality, from lack of the rigorous Russian inspection. Various species, especially *R. Rhaponticum* and *R. palmatum*, have been grown in England and elsewhere in Europe for the root, but the product is inferior, from difference either of species or of conditions. The common garden *rhubarb* is *R. Rhaponticum* and its varieties. It is native from the Volga to central Asia, and was introduced into England about 1678. Its leaves were early used as a pot-herb, but the now common use of its tender acidulous leafstalks as a spring substitute for fruit

in making tarts, pies, etc., is only of recent date. Attempts to use it as a wine-plant have not been specially successful. Some other species have a similar acid quality. From their stature and huge leaves, various *rhubarbs* produce striking scenic effects, especially *R. nodi*, the Nepal *rhubarb*, which grows 5 feet high and has wrinkled leaves veined with red; and still more the better-formed *R. officinale*. A finer and most remarkable species is *R. nodi*, the Sikhim *rhubarb*, which presents a conical tower of imbricated foliage a yard or more high, the ample shining-green root-leaves passing into large straw-colored bracts which conceal beautiful pink stipules and small green flowers. The root is very long, winding among the rocks. This plant is not easily cultivated.

2. The root of any medicinal *rhubarb*, or some preparation of it. *Rhubarb* is a much-prized remedy, remarkable as combining a cathartic with an astringent effect, the latter succeeding the former. It is also tonic and stomachic. It is administered in substance or in various preparations.

The patient that doth determine to receive a little *Rheubarb* suffereth the bitterness it leaveth in the throat for the profit it doth him against his fever.

Guerrara, *Letters* (tr. by Hellowes, 1577), p. 242.

What *rhubarb*, cyme, or what purgative drug,

Would scour these English hence?

Shak., *Macbeth*, v. 3. 55.

3. The leafstalks of the garden *rhubarb* collectively; pie-plant.—**Bog-rhubarb**. See *Petasites*.—**Compound powder of rhubarb**. See *powder*.—**False rhubarb**, *Thalictrum flavum*.—**Monk's rhubarb**, the patience-dock, *Rumex Patientia*, probably from the use of its root like *rhubarb*; also, a species of meadow-rue, *Thalictrum flavum*.—**Poor man's rhubarb**, *Thalictrum flavum*.

rhubb, **rumb** (rumb or rum), *n.* [Formerly also *rhume*, *roomb*, *roumb*, *roumbe*; prob. < OF. *rhomb*, *rumb*, *rhombe*, a point of the compass, < Sp. *rumbo*, a course, point of the compass, = Pg. *rumbo*, *rumo*, a ship's course (*quarto do rumo*, a point of the compass), = It. *rombo*, < L. *rhombus*, a magician's circle, a rhombus, < Gr. *ῥόμβος*, a spinning-top, a magic wheel, a whirling motion, a rhomb in geometry: see *rhomb*.] 1. A vertical circle of the celestial sphere. So says Hutton; but if so, it is difficult to understand how Kepler (*Epitom. Astron.*, II. 10), in order to explain def. 2, is driven to the trapezoidal figure of the points on the compass-card.

2. A point of the compass, a thirty-second part of the circle of the horizon, 11° 15' in azimuth.—3. The course of a ship constantly moving at the same angle to its meridian; a *rhubb-line*.

rhubb-line (rumb'lin), *n.* The curve described upon the terrestrial spheroid by a ship sailing on one course—that is, always in the same direction relatively to the north point. For long courses, especially in high latitudes, the *rhubb-line* is not the shortest or geodetical line, which is substantially a great circle; for the *rhubb-line* evidently goes round and round the pole, approximating to the equiangular spiral. Also called *loxodromic curve*.

It is characterized by flowers with from four to ten stamens, a solitary ovule pendulous from a basilar stalk, a small four- to six-cleft calyx, and four to six imbricated petals unchanged after flowering. The leaves are pinnate, one- to three-foliate, or sometimes simple; the flowers are small, in axillary or terminal panicles; the fruit is a small compressed drupe. The plant often abounds in a caustic poisonous juice, sometimes exudes a varnish. There are about 120 species, found throughout subtropical and warm climates, but infrequent in the tropics. They are especially abundant at the Cape of Good Hope, also in eastern Asia; 4 species are found in southern Europe, a few in the East Indies and the Andes, and 13 in the United States. Several species, some useful for tanning, are known as *sumac*. (For poisonous American species, see *poison-ivy*, *poison-oak*, and *poisonwood*.) *R. Cotinus* is the smoke-tree, mist-tree, or purple fringe-tree. (See *smoke-tree*; also *young fustic*, under *fustic*.) A somewhat similar species, *R. cotinoides*, is known as *chittam-wood*. *R. verniciifera* is the Japanese lacquer-tree or varnish-tree. (See *lacquer-tree*.) The kindred black-varnish tree is of the genus *Melanorrhæa*. *R. succedanea* is the Japanese wax-tree. *R. semialata* bears the Chinese galls. *R. cavaica*, the lithy-tree of Chili, is a small tree with very hard useful wood. *R. integrifolia*, though often but a shrub, is said to be the local "mahogany" in Lower California. See cut in preceding column.

rhusma (rus'mā), *n.* [Also *rusma*; origin unknown.] A depilatory composed of lime, opiment, and water, and called in the United States Dispensatory "Atkinson's depilatory." A section of tetramerous coleopterous insects, characterized by the (usual) prolongation of the head into a snout or proboscis (whence the name); the weevils, curculios, or snout-beetles. In Latreille's classification (1807), the *Rhynchophora* were the first family of the *Coleoptera tetramera*. They have the palpi typically rigid, without distinct palparie, the maxillary four-jointed and the labial three-jointed; labrum typically absent; gular sutures confluent on the median line; prosternum cut off behind by the epimera, and prosternal sutures wanting; and the epipleurae of the elytra generally wanting. The characteristic beak or rostrum varies from a mere vestige in some of these insects to three times the length of the body. The antennæ are generally elbowed or geniculate, with the basal joint or scape received into a groove or scrobe. The larvae are legless grubs; some spin a cocoon in which to pupate. This suborder is divided into 3 series, and contains 13 families. The species are all vegetable-feeders except *Brachytarsus*, which is said to feed on bark-lice. rhyolite (ri-ō-lit), *n.* [Irreg. < Gr. *ῥιάς*, a stream, esp. a stream of lava from a volcano (< *ῥέω*, flow: see *rheum*), + *λίθος*, a stone.] The name given by Richthofen to certain rocks occurring in Hungary which resemble trachyte, but are distinguished from it by the presence of quartz as an essential ingredient, and also by a great variety of texture, showing more distinctly than rocks usually do that the material had flowed while in a viscous state. The name *liparite* was given later by J. Roth to rocks of similar character occurring on the Lipari Islands. Non-vitreous rocks of this kind had previously been called *trachytic porphyries*, and they have also been designated as *quartz-trachytes*. Later Richthofen proposed the name of *nevadite* (also called *granitic rhyolite* by Zirkel) for the variety in which large macroscopic ingredients, like quartz and sanidine, predominated over the ground-mass, retaining the name *liparite*, and applying it to the varieties having a porphyritic or felsitic structure, and limiting the term *rhyolite* to the lithoidal and hyaline modifications, such as obsidian, pumice-stone, and perlite; and nearly the same nomenclature was adopted by Zirkel. Rosenbusch recognizes as structural types of the rhyolitic rocks *nevadite*, *liparite* proper, and glassy *liparite*, remarking that these names correspond closely to Zirkel's *nevadite*, *rhyolite*, and glassy *rhyolite* respectively. These rocks are abundant in various countries, especially in the Cordilleran region, and are interesting from their connection and association with certain important metalliferous deposits. See cut under *axiolite*.

see *rheum*¹. The word *rhythm*, variously spelled, was formerly much confused with *rime*, which thus came to be spelled *rhyme*: see *rime*¹.] 1. Movement in time, characterized by equality of measures and by alternation of tension (stress) and relaxation. The word *rhythm* (*ῥυθμός*) means 'flow,' and, by development from this sense, 'uniform movement, perceptible as such, and accordingly divisible into measures, the measures marked by the recurrence of stress.' Examples of rhythm, in its stricter sense, in nature are respiration and the beating of the pulse, also the effect produced on the ear by the steady dripping of water. The three arts regulated by rhythm are music, metrics, and, according to the ancients, orphic, or the art of rhythmical bodily movement. Rhythm in language is *meter*. The term was further extended to sculpture, etc. (compare def. 5), as when a writer speaks of "the rhythm of Myron's Discobolus."

We have here the three principal applications of *rhythm*, three principal domains in which *rhythm* manifests its nature and power — dancing, music, poetry.

J. Hadley, *Essays*, p. 81.

2. In music: (a) That characteristic of all composition which depends on the regular succession of relatively heavy and light accents, beats, or pulses: accentual structure in the abstract. Strictly speaking, the organic partition of a piece into equal measures, and also the distribution of long and short tones within measures, in addition to the formation of larger divisions, like phrases, sections, etc., are matters of *meter*, because they have to do primarily with time-values; while everything that concerns accent and accentual groups is more fitly arranged under *rhythm*. But this distinction is often ignored or denied, *meter* and *rhythm* being used either indiscriminately, or even in exactly the reverse sense to the above. (See *meter*².) In any case, in musical analysis, *rhythm* and *meter* are coordinate with *melody* and *harmony* in the abstract sense.

(b) A particular accentual pattern typical of all the measures of a given piece or movement. Such patterns or rhythms are made up of accents, beats, or pulses of equal duration, but of different dynamic importance. A rhythm of two beats to the measure is often called a two-part rhythm; one of three beats, a three-part rhythm, etc. Almost all rhythms may be reduced to two principal kinds: *duple* or two-part, consisting of a heavy accent or beat and a light one (often called *march rhythm* or *common time*); and *triple* or three-part, consisting of a heavy accent or beat and two light ones (*waltz rhythm*). The accent or beat with which a rhythm begins is called the *primary accent*. Its place is marked in written music by a bar, and in conducting by a down-beat. Each part of a rhythm may be made compound by subdivision into two or three secondary parts, which form duple or triple groups within themselves. Thus, if each part of a duple rhythm is replaced by duple secondary groups, a four-part or *quadruple* rhythm is produced, or if by triple secondary groups, a six-part or *sextuple* rhythm (first variety). By a similar process of replacement, from a triple rhythm may be derived a six-part or *sextuple* rhythm (second variety) and a nine-part or *nonuple* rhythm; and from a quadruple rhythm, an eight-part or *octuple* rhythm and a twelve-part or *dodecuple* rhythm. The constituent groups of compound rhythms always retain the relative importance of the simple part from which they are derived. The above eight rhythms are all that are ordinarily used, though quintuple, septuple, decuple, and other rhythms occasionally appear, usually in isolated groups of tones. (See *quintuple*, *septuple*, *decuple*, etc.) In ancient music a measure did not necessarily begin with a beat, and the rhythms were the same as those indicated in metrics below (3 (b)). While all music is constructed on these patterns, the pattern is not always shown in the tones or chords as sounded. The time-value of one or more parts may be supplied by a silence or rest. A single tone or chord may be made to include two or more parts, especially in compound rhythms; and thus every possible combination of long and short tones occurs within each rhythm. When a weak accent is thus made to coalesce with a following heavier one, especially if the latter is a primary accent, the rhythm is syncopated. (See *syncopation*.) The regularity of a rhythm is maintained by counting or beating time — that is, marking each part by a word or motion, with a suitable difference of emphasis between the heavy and the light accents. In written music the rhythm of a piece or movement is indicated at the outset by the *rhythmical signature* (which see, under *rhythmical*). The speed of a rhythm in a given case — that is, the time-value assigned to each measure and part — is called its *tempo* (which see). Rhythm and tempo are wholly independent in the abstract, but the tempo of a given piece is approximately fixed. Although regularity and definiteness of rhythm are characteristic of all music, various influences tend to modify and obliterate its form. The metrical patterns of successive measures often differ widely from the typical rhythmic pattern and from each other. Except in very rudimentary music, purely rhythmic accents are constantly superseded by accents belonging to figures and phrases — that is, to units of higher degree than measures. Indeed, in advancing from rudimentary to highly artistic music, rhythmic patterns become less and less apparent, though furnishing everywhere a firm and continuous accentual groundwork. Rhythm is often loosely called *time*. Also called *proportion*.

3. In metrics: (a) Succession of times divisible into measures with theses and arses; metrical movement. Theoretically, all spoken language possesses rhythm, but the name is distinctively given to that which is not too complicated to be easily perceived as such. Rhythm, so limited, is indispensable in metrical composition, but is regarded as inappropriate in prose, except in elevated style and in oratory, and even in these only in the way of vague suggestion, unless in certain passages of special character.

Rhythm, . . . is of course governed by law, but it is a law which transcends in subtlety the conscious art of the metrist, and is only caught by the poet in his most inspired moods.

Encyc. Brit., XIX. 262.

(b) A particular kind or variety of metrical movement, expressed by a succession of a particular kind or variety of feet: as, iambic rhythm; dactylic rhythm. In ancient metrics, rhythm is *isorhythmic*, *direct*, or *doctylic* (see the phrases below), or belongs to a subdivision of these. (c) A measure or foot. (d) Verse, as opposed to prose. See *rime*¹.—4. In physics and physiol., succession of alternate and opposite or correlative states.

The longer astronomic *rhythm*, known as the earth's annual revolution, causes corresponding *rhythms* in vegetable and animal life: witness the blossoming and leading of plants in the spring; the revival of insect activity at the same season; the periodic flights of migratory birds; the hibernating sleep of many vertebrates, and the thickened coats or the altered habits of others that do not hibernate.

J. Fiske, *Cosmic Philos.*, I. 307.

5. In the graphic and plastic arts, a proper relation and interdependence of parts with reference to each other and to an artistic whole.

—*Ascending rhythm*. See *ascending*. —*Descending or falling rhythm*. See *descending*. —*Direct rhythm*, in *anc. metrics*, rhythm in which the number of times or more in the thesis of the foot differs from that in the arsis by one. Direct rhythm includes diplasic, hemiolie, and epitritic rhythm, these having a pedal ratio (proportion of more in arsis and thesis) of 1 to 2, 2 to 3, and 3 to 4 respectively: opposed to *doctylic rhythm*. —*Doctylic rhythm*, in *anc. metrics*, rhythm in which the number of times in the arsis differs from that in the thesis by more than one. Doctylic rhythm in this wider sense includes *doctylic rhythm* in the narrower sense (that is, the rhythm of the doctylicus, which has a pedal ratio of 3 to 5), and *triplasic rhythm*, characterized by a pedal ratio of 1 to 3. —*Double rhythm*. Same as *duple rhythm*. See def. 2. —*Equal rhythm*, *isorhythmic rhythm*, in *anc. metrics*, rhythm in which the number of times in the thesis and arsis is equal. Also called *dactylic rhythm*. —*Imperfect rhythm*. Same as *imperfect measure*. See *imperfect*. —*Oblique rhythm*. Same as *doctylic rhythm*. = *Syn. 2. Melody, Harmony*, etc. See *euphony*.

2. In physics and physiol., pertaining to or constituting a succession of alternate and opposite or correlative states.

W. B. Carpenter, *Micros.*, vi. § 246.

3. In med., periodical.—4. In the graphic and plastic arts, properly proportioned or balanced.

—*Rhythmical signature*, in *musical notation*, a sign placed at the beginning of a piece, after the key-signature, to indicate its rhythm or time. (Also called *time-signature*.) It consists of two numerals placed one above the other on each staff, the upper numeral indicating the number of principal beats or pulses to the measure, and the lower the kind of note which in the given piece is assigned to each beat. (See *rhythm* and *note*, 13.) Thus, 4 indicates quadruple rhythm, four beats to the measure, each beat marked by a quarter-note, or its equivalent. Difference of rhythm is unfortunately not always indicated by difference of rhythmic signature; and difference of signature often means only an unessential difference of notes rather than of rhythm. Thus, duple rhythm may be marked either by 2, 2, 4, 2, or 4; triple rhythm, by 3, 2, 3, 2, 4; quadruple rhythm, by 4, 2, 4, 2; sextuple rhythm (first variety), by 6, 2; sextuple rhythm (second variety), by 3, 2, 3, 2; octuple rhythm, by 8, 2; nonuple rhythm, by 9, 2; dodecuple rhythm, by 12, 2. Most of the varieties of duple and quadruple signatures are often written simply C, common: when duple rhythm is to be distinguished from quadruple, this sign is changed to Q, or the words *alla breve* are added. The rhythmic signature is not repeated on successive staves. A decided change of rhythm is marked by a new signature; but the isolated intrusion of a foreign rhythm, especially in a short melodic group, is usually marked by a curve and an enclosed numeral, as 3, 4. See *triple*, *quadruple*, *quintuple*, etc.

Russ. *rebro*, rib, and prob., as 'that which incloses or envelops,' to G. *rebe*, a tendril, vine (cf. OHG. *hirni-reba*, MHG. *hirnrebe*, that which envelops the brain, the skull).] 1. In anat. and zool., a costa; a pleurapophysis, with or without a hemapophysis; the pleurapophysis: a element of a vertebra, of whatever size, shape, or mode of connection with a vertebra. In ordinary language the term *rib* is restricted to one of the series of long slender bones which are movably articulated with or entirely disconnected from the vertebrae, occur in pairs, and extend to or toward the sternum or middle ventral line of the body. In many vertebrates such ribs are characteristic of or confined to the thoracic or dorsal region, and form, together with the corresponding vertebrae and with the sternum, a kind of bony cage for the thoracic viscera—the chest or thorax. Such ribs are called *thoracic* or *dorsal*, and are often the only free ribs an animal may possess, as is usually the case in mammals. In man there are twelve pairs of such ribs. The first of these articulates with the upper part of the side of the body of the first dorsal vertebra; the second to the ninth inclusive articulate at an intervertebral space, and consequently with two vertebrae apiece; the tenth, eleventh, and twelfth articulate with the single vertebra to which they correspond. The first to the tenth ribs articulate by their heads with bodies of vertebrae as above stated, and also by their shoulders with transverse processes, which latter articulations are lacking to the eleventh and twelfth ribs. The first seven ribs reach the sternum by means of costal cartilages, and are called *true ribs*; the last five ribs do not, and are called *false ribs*: of these last the first three join one another by means of their costal cartilages, while the last two are entirely free or "floating" at their ends. Only the bony part of a rib is a pleurapophysis; the gristly part, or costal cartilage, is a hemapophysis. Parts of a bony rib commonly distinguished are the *head* or *capitulum*, the *neck* or *cervix*, the *shoulder* or *tuberculum*, and the *shaft*. Most of the ribs are not only curved as a whole, but also somewhat bent at a point called the *angle*, and, moreover, twisted on their own axis. In man there are occasionally supernumerary cervical or lumbar ribs of ordinary character, that are extended from and freely jointed to their vertebrae; and all the human cervical vertebrae have rudimentary ribs ankylosed with their respective vertebrae, represented by that part of the transverse process which bounds the vertebral foramen in front. Mammals have frequently more or fewer than twelve pairs of thoracic ribs. Ribs occurring in any part of the vertebral column are named from that part:

Human Ribs, left side (rear view), the first, second, seventh, ninth, and twelfth shaded in detail, the others in outline—all without their costal cartilages.

as, cervical, thoracic or dorsal, dorsolumbar, lumbar, or sacral ribs. In birds and reptiles the number of ribs is extremely variable, and their situation may extend from head to tail. Frequently they are jointed in the middle, or at the point where in a mammal the bony part joins the cartilaginous. Some of them may be free or floating at the vertebral as well as at the sternal end. Some ribs in birds bear peculiar splint-bones called *uncinate processes*. (See cut under *epipneura*.) In chelonians the ribs are fixed, and consolidated with broad plate-like dermal bones to form the carapace. The greatest number of ribs is found in some serpents, which have more than two hundred pairs. In some fishes, ribs are apparently doubled in number by forking; this is the principal reason why the bones of a shad, for example, seem so numerous. See also cuts under *carapace* and *skeleton*.

Ut of his side he toc a rib,
And made a wimman him ful rib,
And heled him that side wel.

Genesis and Exodus (E. E. T. S.), I. 227.

2. That which resembles a rib in use, position, etc.; a strip, band, or piece of anything when used as a support, or as a member of a framework or skeleton.

Thirdly, in setting on of your fether [a question may be asked], whether it be pared or drawn with a thicke *rybbe*, or a thinne *rybbe* (the *rybbe* is ye hard quill whiche deyndeth the fether).

Jer. Taylor, Holy Dying, III. 9.

He consulted to remove the whole wall by binding it about with ribs of iron and timber, to convey it into France.

Evelyn, Diary, March 23, 1666.

Specifically—(a) Some part or organ of an animal like or likened to a rib; a costate or costiform process; a long narrow thickening of a surface; a ridge; a strip or stripe: as, (1) one of the veins or nerves of an insect's wing; (2) one of a set or series of parallel or radiating ridges on a shell; (3) one of the ciliated rays or ctenophores of a ctenophoran. (b) In ship-building, one of the bent timber or metallic bars which spring from the keel, and form or strengthen the side of the ship.

How like the prodigal doth she return,
With over-weather'd ribs and rugged sails!

Shak., M. of V., II. 6. 18.

(c) In arch.: (1) In vaulting, a plain or variously molded and sculptured arch, properly supporting a vault, or, in combination with other ribs, the filling of a groin-vault. In pointed vaults the groins typically rest upon or are covered by ribs; and secondary ribs connecting the main ribs, especially in late and less pure designs, are sometimes applied, usually as a mere decoration, to the plain surfaces of the vaulting-cells. The three main vaulting-ribs are designated as (a) groin-ribs or ogives, (b) doubleaux, and (c) formerets. (See plan under *arch*.) Ribs upon the surfaces of the cells are known as *surface-ribs*. The groin-rib or ogive is also called the *diagonal rib*, because it occupies the diagonal of the plan of a quadripartite vault. See *arch* and *arc*.

All these ribs [of Notre Dame Cathedral, Paris] are independent arches, which determine the forms of, and actually sustain, the vault shells.

C. H. Moore, Gothic Architecture, p. 52.

(2) An arch-formed piece of timber for supporting the lath-and-plaster work of pseudo-domes, vaults, etc. (d) In coal-mining, a narrow strip or block of solid coal left to support the workings. (e) One of the curved extension rods on which the cover of an umbrella is stretched.

Let Persian Dames th' Umbrella's Ribs display,
To guard their Beauties from the sunny Ray.

Gay, Trivia, i.

(f) In bot.: (1) One of the principal vascular bundles, otherwise called *nerves* or *veins*, into which the primary bundle divides on entering the blade to form the framework of a leaf, commonly salient on its lower surface; a primary nerve: contrasted with *vein* and *veinlet*, the branches to which it gives origin. See *midrib* and *nerivation*. (2) A prominent line on the surface of some other organ, as the fruit. (g) In cloth or knitted work, a ridge or stripe rising from the groundwork of the material, as in corduroy. (h) In bookbinding, one of the ridges on the back of a book, which serve for covering the tapes and for ornament. (i) One of the narrow tracks or ways of iron in which the bed of a printing-press slides to and from impression. (j) In mach., an angle-plate cast between two other plates, to brace and strengthen them, as between the sole and wall-plate of a bracket. (k) In a violin or similar instrument, one of the curved sides of the body, separating the belly from the back. (l) In gun-making, either of the longitudinally extending upper or lower projections of the metal which join the barrels of a double-barreled gun, and which in fine guns are often ornamented or of ornamental shape. The upper rib is called the *top rib*; the lower, the *bottom rib*.

3. A piece of meat containing one or more ribs; a rib-piece: as, a *rib* of beef.—4. A wife: in allusion to Eve, who, according to the account in Genesis, was formed out of one of Adam's ribs. [Humorous.]

5. A strip; a band or ribbon; a long and narrow piece of anything.

See *abdominal*.—**Back** of a rib, in *arch*, the upper surface of a vaulting rib.—**Built** rib, in *arch*, for bridges or roofs, a rib constructed of several layers of planks set on edge, breaking joints, and united by bolts.—**Diagonal rib**, in *arch*. See def. 2 (c) (1).—**False rib**. See def. 1.—**Floating rib**, a rib unattached

at one or both ends; a free or false rib, as the eleventh or twelfth of man.—**Laminated rib**, in *arch*, a rib constructed of layers of plank, laid flat, one over another, and bolted together.—**Longitudinal rib**, in *arch*, a formeret, or arc formeret. It is of rare occurrence except in English medieval vaulting, and is not used in vaults of the most correct and scientific design.—**Sacral rib**, the pleurapophysis of a sacral vertebra, of whatever character. The very complex sacrum of a bird often bears articulated or ankylosed ribs of ordinary character, called *sacral*, though these may be really lumbo-sacral, or dorsolumbar. No mammal has such sacral ribs; but the whole "lateral mass," so called, of a mammalian sacrum, as in man, which ossifies from several independent centers, is regarded by some anatomists as pleurapophyseal, and therefore as representing a consolidation of sacral ribs.—**Surface-rib**, in *arch*, a rib without constructive office, applied to the surface of vaulting merely for ornament; a lierne, tierceron, etc. Such ribs, as a rule, were not used until after the best time of medieval vaulting.—**To give a rib of roast**, to rib-roast; thrash soundly. See *rib-roast*.

Though the skorneful do mocke me for a time, yet in the ende I hope to give them al a *rybbe* of *roste* for their paynes.

Transverse rib, in *arch*, a doubleau or arc doubleau. See plan under *arch*.—**Wall-rib**, in *arch*, same as *arc formeret* (which see, under *arch*).

1. The grain of the rice-plant. It forms a larger part of human food than the product of any other one plant, being often an almost exclusive diet in India, China, and the Malayan islands, and abundantly used elsewhere. Over 75 per cent. of its substance consists of starchy matter, but it is deficient in albuminoids, the flesh-forming material, and is thus best adapted for use in warm climates. It is commonly prepared by boiling; in warm countries it is much employed in curries. Rice-flour, rice-glue, rice-starch, rice-sugar, and rice-water are made from it; the *sake* of the Japanese is brewed from rice, and one kind of true arrack is distilled from it.

2. The rice-plant, *Oryza sativa*. It is a member of the grass family (see *Oryza*), native in India, also in northern Australia; extensively cultivated in India, China, Malaysia, Brazil, the southern United States, and somewhat in Italy and Spain. It has numerous natural and cultivated varieties, and ranges in height from 1 to 6 feet. It requires for ripening a temperature of from sixty to eighty degrees, and in general can be grown only on irrigable land (but see *mountain-rice*). Rice is one of the most prolific of all crops. It was introduced into South Carolina about 1700—it is

said by chance. The finest quality is produced in the United States, South Carolina and Georgia leading in amount; but the production has considerably declined since the civil war.—**Canada rice**. Same as *Indian rice*.—**False rice**, a grass of the rice-like genus *Leersia*.—**Hungary rice**, a corruption of *hungry rice*.—**Hungry rice**. Same as *fundi*—*Indian rice*. (a) A reed-like grass, *Zizania aquatica*, common in shallow water in eastern North America, and especially abundant northwestward. The seeds, which are slender and half an inch long, are farinaceous, much eaten by birds, and largely gathered by the Indians in canoes; but they fall so easily as to render the plant unfit for cropping, even if otherwise worthy. The straw has been recommended as a paper-stock. Its height and large monocious panicle render it a striking plant. A more southerly species, *Z. miliacea*, is included under the name. Also called *Canada* or *wild rice*, and *Indian oats* or *water-oats*. (b) Rice produced in India.—**Millet-rice**, the East Indian *Panicum edoum*.—**Petty-rice**. See *Quinoa*.—**Rice cut-grass**. See *cut-grass*.—**Rice-grain decoration**, in *ceram.*, a kind of decoration used in porcelain, especially Chinese, and in fine earthenware, as sometimes in Persian work. The paste of a cup or bowl is cut through with a stamp bearing small leaf-shaped or oval openings; the vessel being dipped in the glaze and then fired, the glaze fills these openings completely, leaving translucent spots in the opaque vessel. Occasionally the openings are of different shapes, as small stars, crosses, etc.—**Rough rice**, the common name for the East Indian paddy or unhusked rice.—**Water-rice**, *wild rice*. A name commonly but erroneously applied to a delicate white film prepared in China from the pith of a shrub, *Fatsia papyrifera*. The pith freed from the stem is an inch or an inch and a half in diameter, and is cut into lengths of about three inches. These by the use of a sharp blade are pared into thin rolls which are flattened and dried under pressure, forming sheets a few inches square. The Chinese draw and paint upon these, and they are much used in the manufacture of artificial flowers, some pith being imported in the stem for the same purpose. In the Malay archipelago the pith of *Scevola Kenigii* furnishes the rice-paper. See *Fatsia*.—**Rice-paper tree**, a small tree, *Fatsia papyrifera*, native in the swamps of Formosa, and cultivated in China, whose pith forms the material of so-called rice-paper. It grows 20 feet high or less, has leaves a foot across, palmately five- to seven-lobed, and clusters of small greenish flowers on long peduncles. From its ample leaves and stately habit, it is a favorite in subtropical planting. The Malayan rice-paper plant, *Scevola Kenigii*, is a sea-shore shrub found from India to Australia and Polynesia. Its young stems are stout and succulent, and yield a pith used like that of *Fatsia*, though smaller. It is the taccada of India and Ceylon.

Richardia (ri-chär'di-ä), *n.* [NL. (Kunth, 1815), named from the French botanists L. C. M. Richard (1754–1821) and his son Achille Richard (1794–1859).] 1. A genus of monocotyledonous plants of the order *Araceæ*, suborder *Philodendroideæ*, and tribe *Richardieæ* (of the last the only genus). It comprises perennial stemless herbs, with monocious flowers without perianth, the two sexes borne close together on the same spadix. The male flowers bear two or three stamens, the female three staminodia. The ovary ripens into a berry of from two to five cells, each containing one or two anatropous albuminous seeds. The leaves are sagittate, and the spadix is surrounded with an open white or yellow spathe, the persistent base of which adheres to the fruit. *R. africana* is the common calla (the *Calla Ethiopica* of Linnaeus), often called *calla-lily* on account of its pure-white spathe. Also called *African* or *Ethiopian lily*, and *lily of the Nile*, though it is native only in South Africa. *R. albo-maculata*, having the leaves variegated with translucent white spots, is also cultivated. There are in all 5 species.

There are 5 or 6 species, natives of warm parts of America. They are erect or prostrate hairy herbs, with a perennial root and round stems, bearing opposite nearly or quite sessile ovate leaves, stipules forming bristly sheaths, and small white or rose-colored flowers in dense heads or whorls. *R. sabra*, with succulent spreading stems and white flowers, has been extensively naturalized from regions further south in the southern United States, where it is known as *Mexican clover*, also as *Spanish* or *Florida clover*, *water-parley*, etc. Though often a weed, it appears to be of some value as a forage-plant, and perhaps of more value as a green manure. See *devil*.—*To ride and tie*, to ride and go on foot alternately: said of two persons. See the first quotation.

Mr. Adams discharged the bill, and they were both setting out, having agreed to *ride and tie*: a method of travelling much used by persons who have but one horse between them, and is thus performed. The two travellers set out together, one on horseback, the other on foot. Now as it generally happens that he on horseback outgoes him on foot, the custom is that when he arrives at the distance agreed on, he is to dismount, tie his horse to some gate, tree, post, or other thing, and then proceed on foot, when the other comes up to the horse, unties him, mounts, and gallops on; till, having passed by his fellow-traveller, he likewise arrives at the place of tying.

To ride upon a cowstaff. See *cowstaff*.—**Syn. 1 and 2**. The effort has been made, in both England and America, to confine *ride* to progression on horseback, and to use *drive* for progression in a vehicle, but it has not been altogether successful, being checked by the counter-tendency to use *drive* only where the person in question holds the reins or where the kind of motion is emphasized.

We have seen that Shakespeare, and Milton, and the translators of the Bible, use *drive* in connection with chariot when they wish to express the urging it along; but, when they wish to say that a man is borne up and onward in a chariot, they use *ride*.

R. G. White, Words and Their Uses, p. 193.

The practice of standard authors is exhibited in a liberal list of citations, and proves the imputed Americanism to *ride* (instead of to *drive*) in a carriage to be "Queen's English," although there remains a nice distinction—not a national one—established by good usage, between *riding* in a carriage and *driving* in a carriage.

The whole arrangement at the bottom of the sluices is usually called *the rifles*.
